In-cabin particle exposure from vehicle emissions

In-car particulate measurement

Colin Dickens

Aerosol Science Centre

S360A/VB In-Car Particulate Exposure.

An AEA Technology research project funded by
the Department of Environment and the Regions, 1999.

In-car particulate exposure Objectives

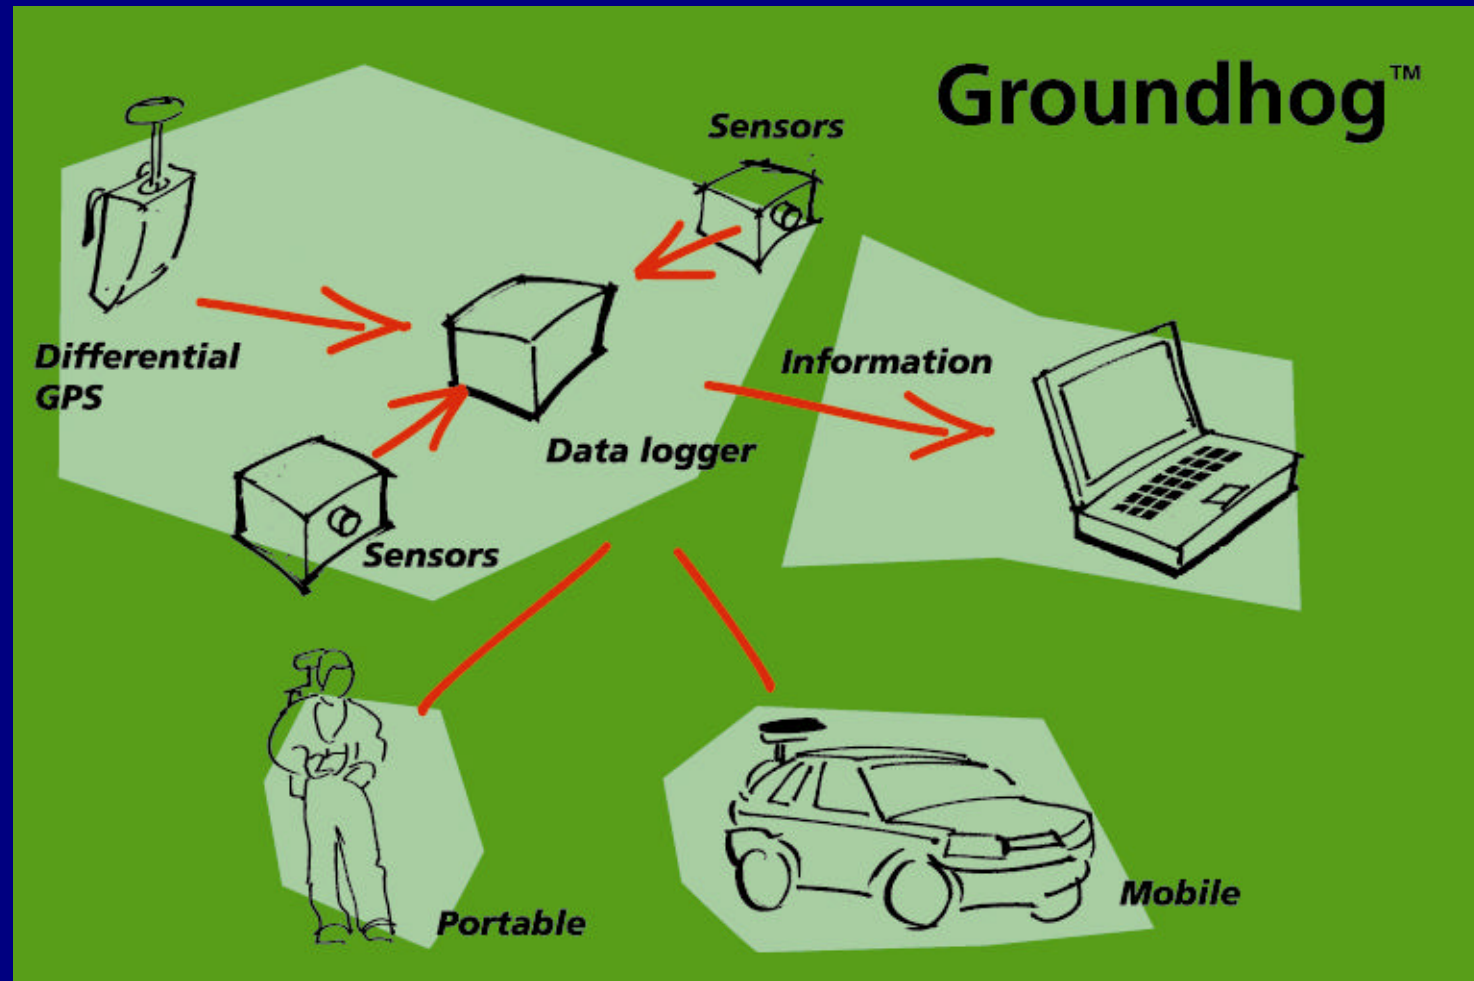

- Measure in-car pollution for commuter journeys
- Weather effects
- Road type and traffic conditions
- Ventilation (heater, windows etc)
- Filters
- Vehicle ahead
- Remedial action?

Slide serial no 2

What is Groundhog?

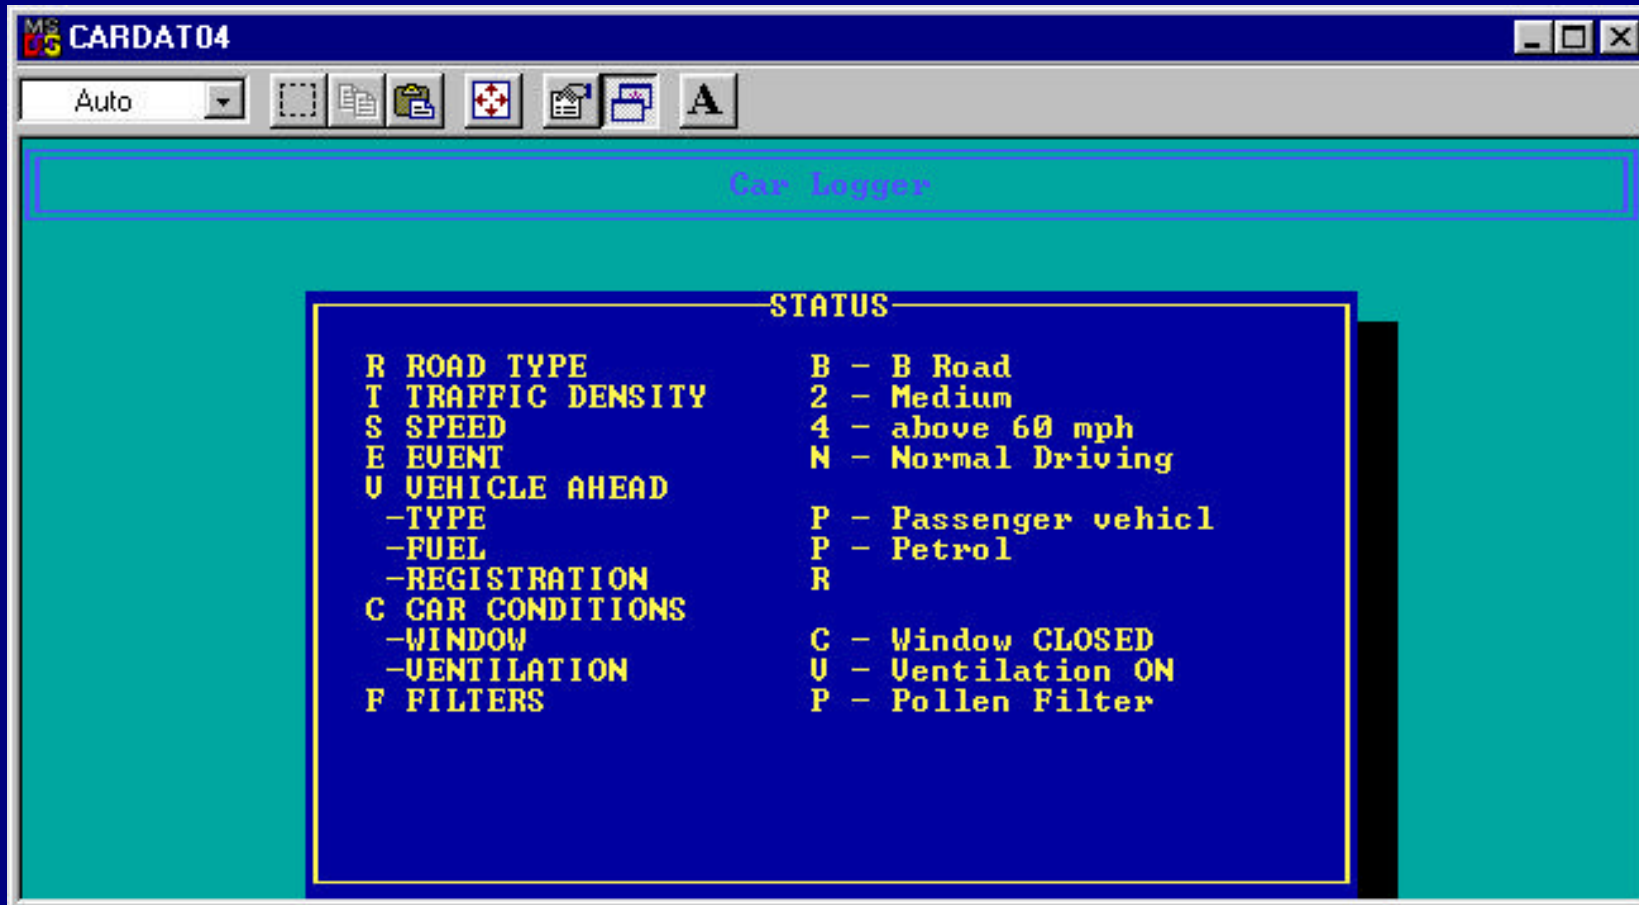

In-car particulate exposure

Project Stages

- Equip test vehicle:
 - particle number & mass
 - NO₂ & CO
 - GPS positional data
 - Video
 - Road/car conditions
- Measure over several commuter trips
- Analyse data

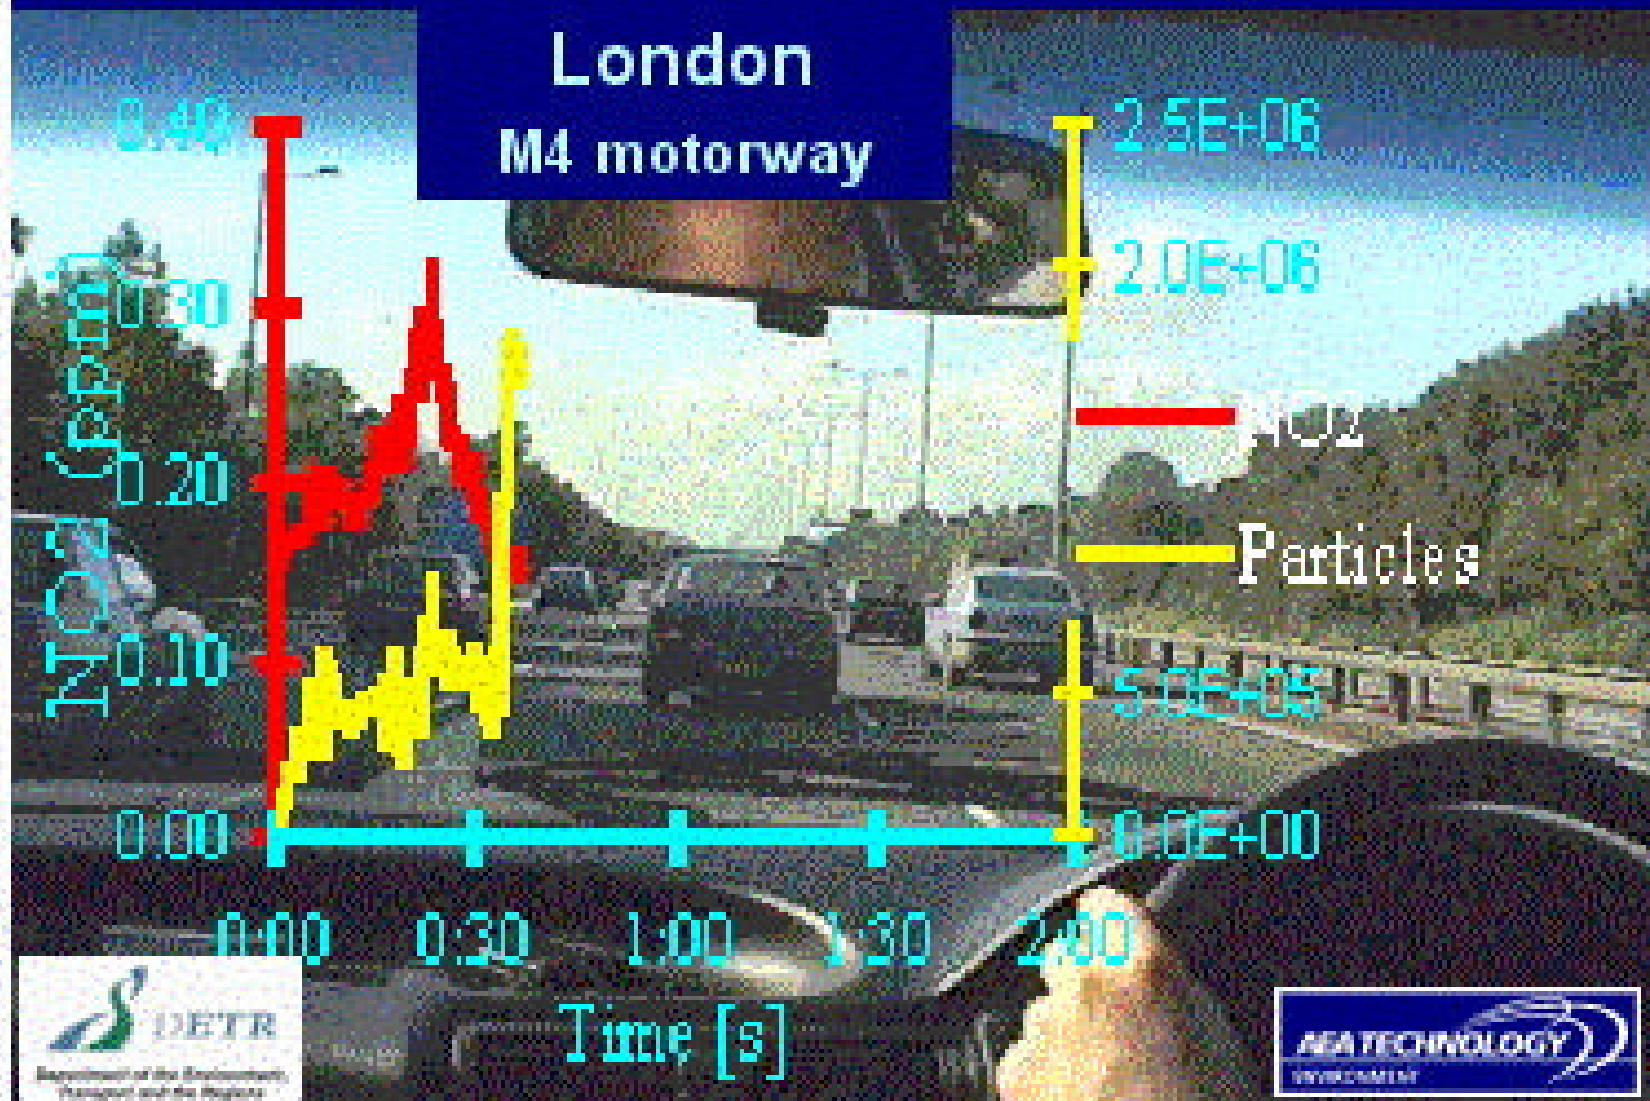

Condition Logging

London to M4

S360A/VB In-Car Particulate Exposure

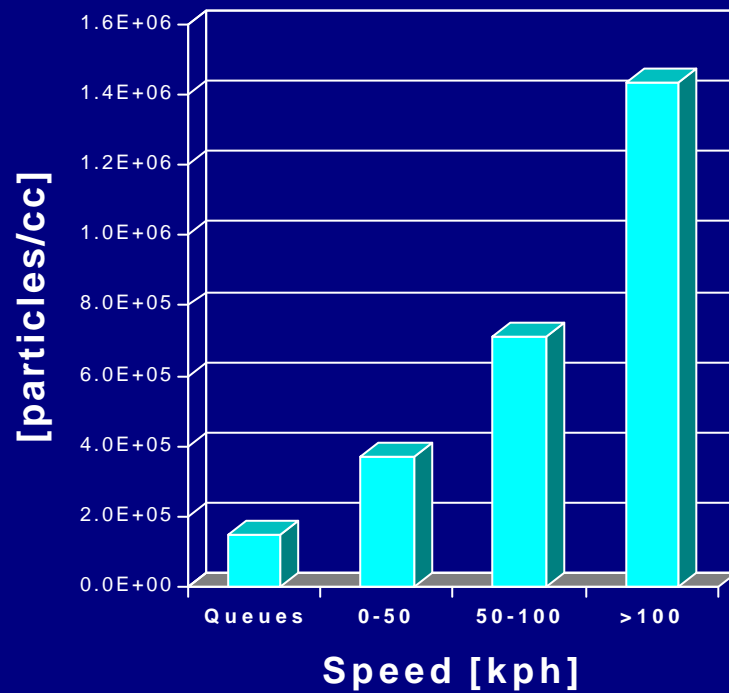

Data Reporting

- 15 days testing, average of 5 hours testing per day, at 1s time resolution
- 180,000 data points x 22 parameters
- Resolved to 'event' periods
- 22,000 data event points x 22 parameters
- Database format, allows queries and correlations

Traffic Speed

Particle Number

- Strong correlation between particle number and speed
- No correlation of NO₂, CO or particle mass with speed

Road Type - Rural/Motorway/City

Particle Number

NO2 Concentration

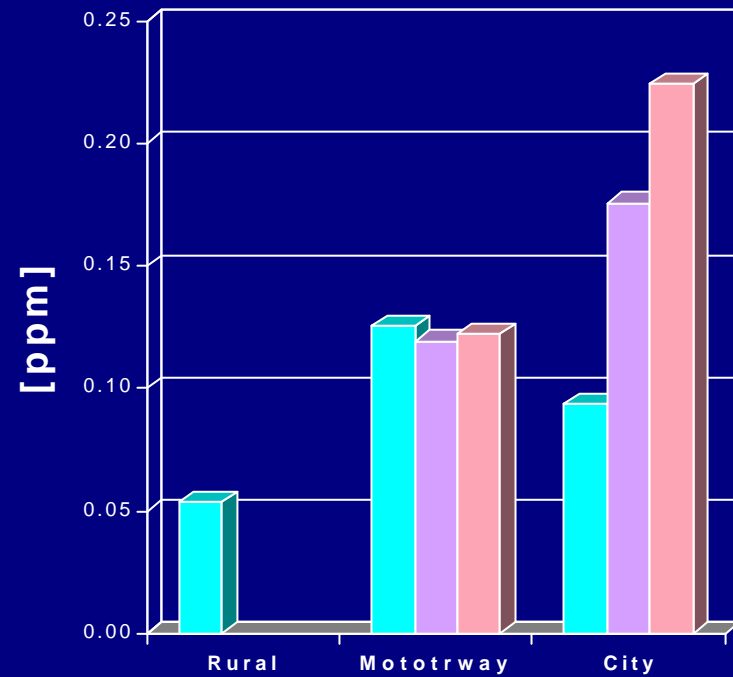

Traffic Density

Particle Number

NO2 Concentration

■ Light ■ Heavy ■ Congested

Pollution Levels

- High pollution levels in vehicles
- NO₂ and CO higher than roadside measurements
- PM same as roadside measurements
- Ultrafine 2 orders of magnitude higher than background
- Average NO₂ and CO levels higher than AQS 2005 targets

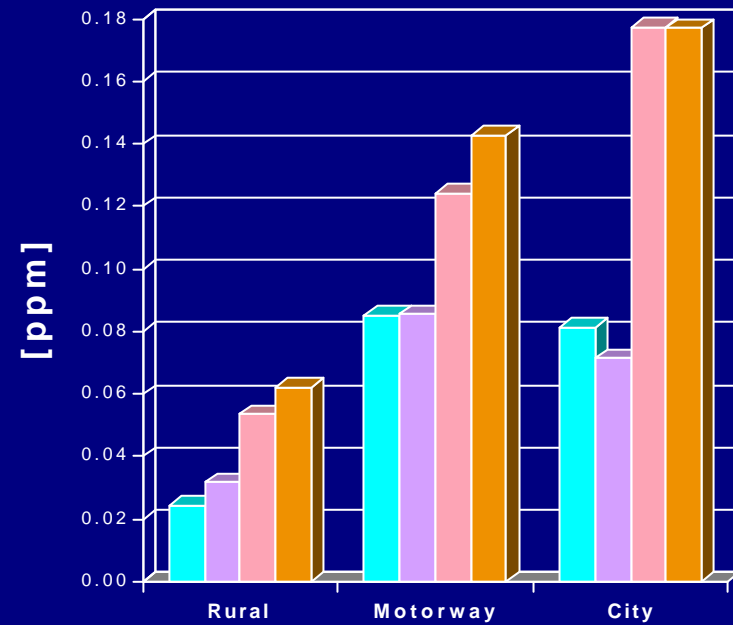

Car Conditions

Particle Number

NO2 Concentration

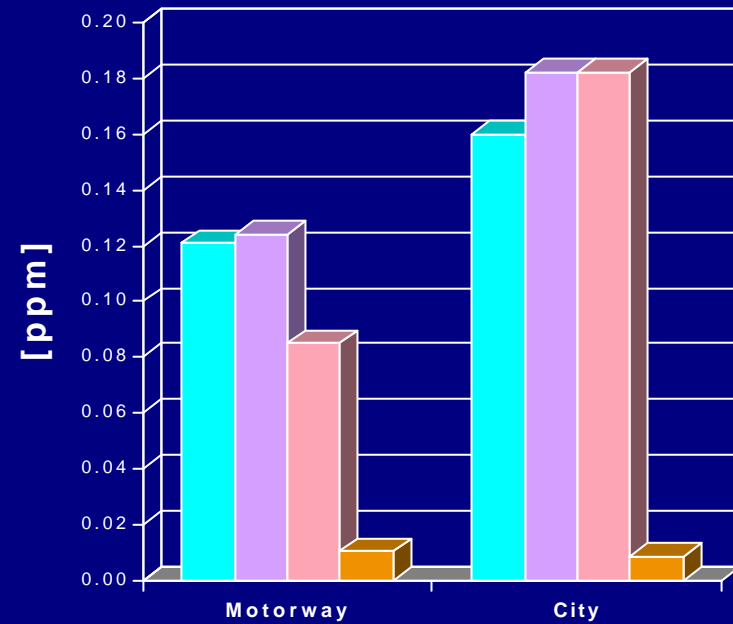

Air Filters

Particle Number

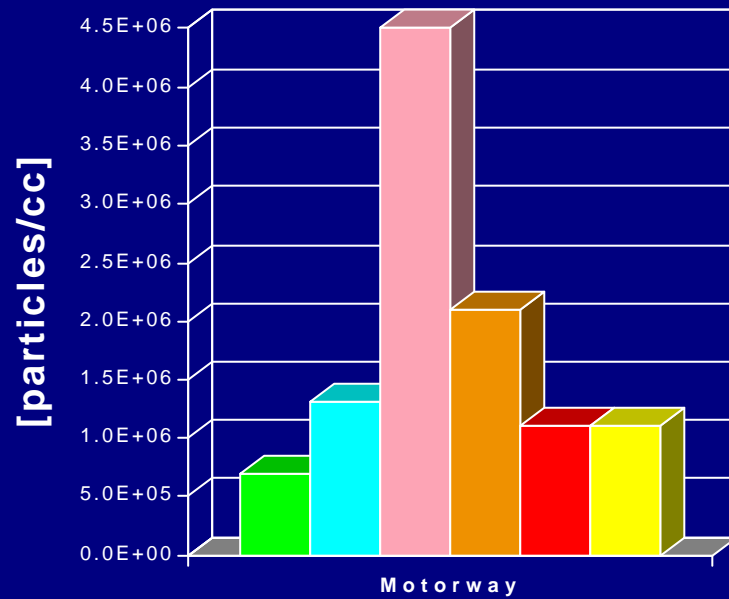

NO2 Concentration

No Filters **Pollen Filters**
Particle Filters **NOx Filters**

Vehicle Ahead - Type

Particle Number - Mean

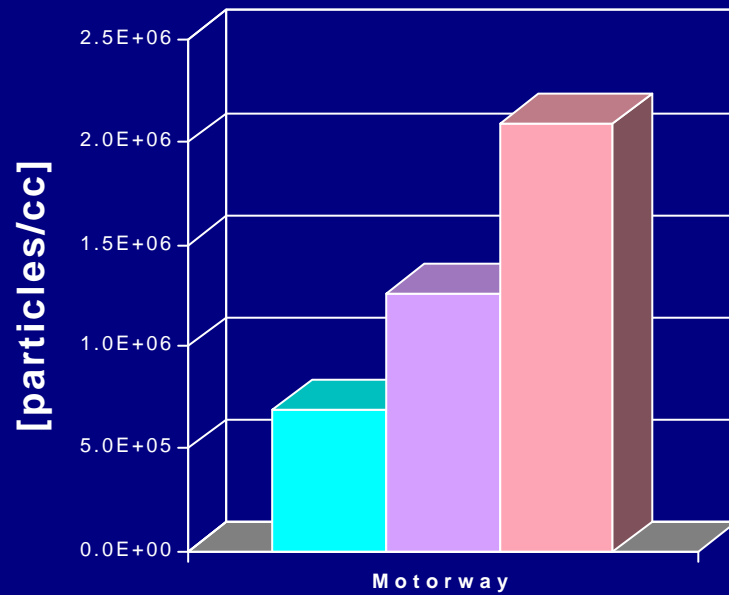

- Median

Vehicle Ahead - Fuel Type

Particle Number - Mean

- Median

■ No Vehicle ■ Gasoline ■ Diesel

Conclusions - In-car

- High levels of pollutants found in-car
- Highest level of ultra-fines from motorway
- Highest level of NO₂ and CO in city, higher than data from nearby AQN site
- Levels of NO₂ in city and on motorway exceed 0.105ppm 1 hour average 2005 AQS target
- Ultra-fines increase with speed
- Diesel ultra-fine higher than gasoline
- Evidence of high gasoline emitters/events
