Effect of Jet Fuel Properties on Solid Particle Number and Mass Emission from Aircraft Gas Turbine Engine: Development of a Jet Fuel Particle Index

Imad A. Khalek, Ph.D., Sr. Program Manager

Imhalek@swri.org, San Antonio, Texas, USA

20th ETH Conference on Combustion Generated Particles, Zurich, Switzerland, June 14-16, 2016
Project Team

- This research was funded by SwRI Internal Research & Development Program:

- Principal Investigator: Imad Khalek, Ph.D.
- Co-Investigator: Nigil Jeyashekar, Ph.D.
- Experimental Efforts: Vinay Premnath, Daniel Preece & Richard Mechler, and Michael Gass
- Fuel Technical Advisor: George Wilson
Our Work

- SwRI has done some very recent experimental work on the effects of fuel properties on particle emissions from a gas turbine combustor:

  - We also developed a Jet Fuel Particle Index (JFPI) for the five fuels tested in the program:

    • The JFPI is a single parameter that combines the chemistry and physics of fuel properties to rank fuels in terms of their soot forming tendency leading to particle emissions
      - Over 800 fuel properties are used to calculate the JFPI

    • The JFPI is an extension of the Gasoline Fuel Particle Index (GFPI) that has gained a lot of momentum in the area of gasoline fuels
T700 Combustor Liner

- Figure 1 is a complete T700 combustor liner manufactured by GE
- Figure 2 is a 3 sector cup
  - Three fuel nozzles
  - Emissions measured at the center cup
- A scaled down version of other combustor designs can be added

Jet A: Commercial Jet Fuel
Particle Measurement (Soot Mass, Solid & Total Particle Number)

Particle Size and Number using Cambustion DMS500 with and without SwRI Catalytic Stripper

Soot Mass Measured by AVL Micro-Soot Sensor
Fuel Particle Index (DBE, VP, Wt)

- Why are the DBE and vapor pressure important factors in the PM Index equation?
  - Fuel components of low vapor pressure evaporate slowly, and promotes local rich burning regions (This could be important at idle, very low temperature)
  - DBE (Double Bond Equivalent) is essentially an indication of the degree of unsaturation of a molecule. Fuel components with high DBE values are typically polyaromatic hydrocarbons (PAHs). PAHs in the fuel are known to be precursors for exhaust particulates.
  - Note that PAHs have high DBE values and very low vapor pressures. Even a small amount of PAHs in the fuel will cause it to have a high PM Index.

* Jet A was omitted because it resulted in high emissions at idle
Summary

- Based on this limited work, we have identified a:
  - Jet Fuel Particle Index (JFPI) that is a continuation of the Gasoline Fuel Particle Index (GFPI)
  - Similar to the GFPI, the JFPI can be used as a predictor of soot forming tendency of Jet fuel in combustion worldwide
  - The JFPI can be used as a singular parameter to represent the sooting tendency of jet fuels worldwide
    - This can be very valuable prior to the upcoming regulations on particle emissions from jet engines
    - This can be also used for fine tuning fuel properties for particle emissions reduction
  
- SwRI plans to continue this development in collaboration of industry/government
  - This can provide valuable information to engine developers and fuel developers, including alternative fuels
