**3rd ETH Workshop on
Nanoparticle Measurement
9th/10th June 1999, Zurich**

Contents

- Description of the engine and the measurement techniques
- In-cylinder soot and gaseous components
- Particle size distribution in the cylinder during fuel injection, combustion and expansion
- Influence of O₂ containing fuel on the particle size distribution in the cylinder
- Conclusions

Engine Data

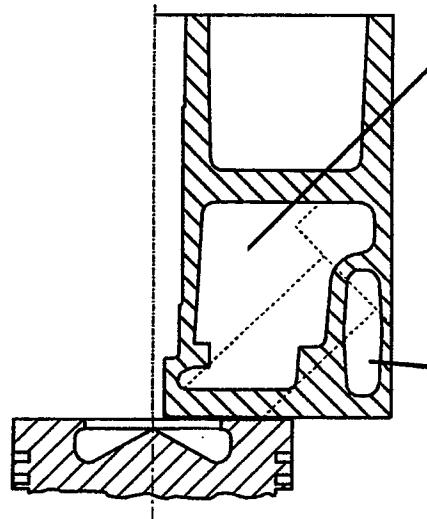

Engine Displacement:	2151 cm³
Number of Cylinders:	4
Maximum Power:	92 kW at 4200 rpm
Cylinder Bore:	88.0 mm
Cylinder Stroke:	88.4 mm
Compression Ratio:	19.0
Injection System:	Common Rail
Number of Injector Holes:	6
Diameter of Injector Holes:	0.169 mm

Engine Operation Conditions

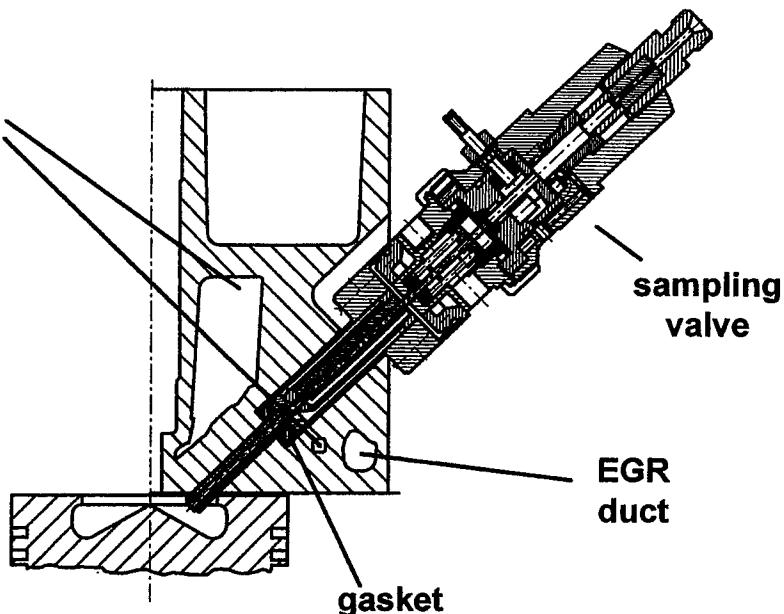

- engine speed: 2000 rpm, bmepl: 2 bar (38 ±2% EGR)
- engine speed: 2000 rpm, imep: 10 bar (w/o EGR)

Adaption of the Sampling Valve

original cylinder head shape

modified cylinder head shape

Results of Fast Gas Sampling In-Cylinder Pollutant Curves (Reference Fuel)

- Particle size distribution in the cylinder during the fuel injection, combustion and expansion

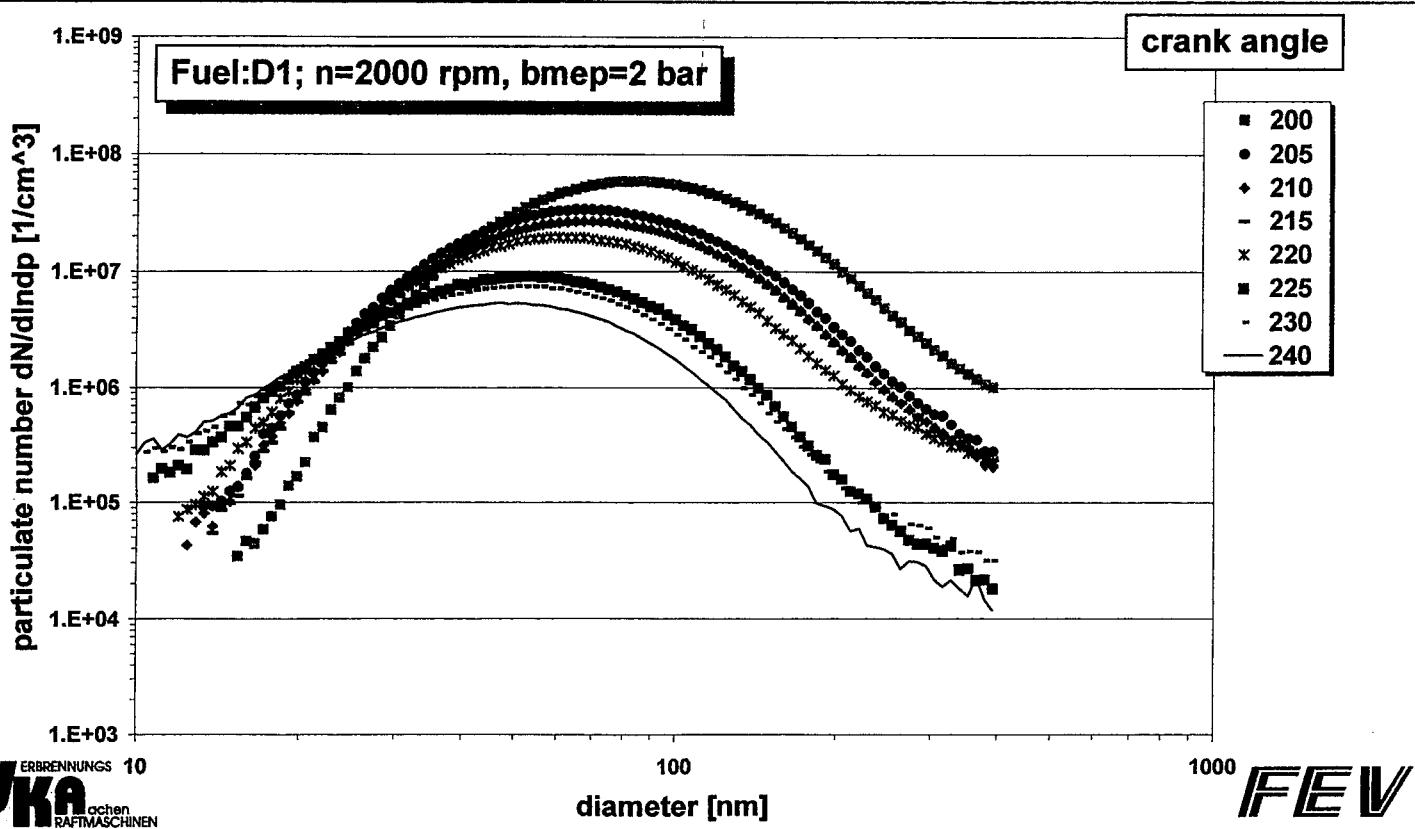

In-Cylinder Particle Size Distributions

Formation of Soot with proceeding Combustion

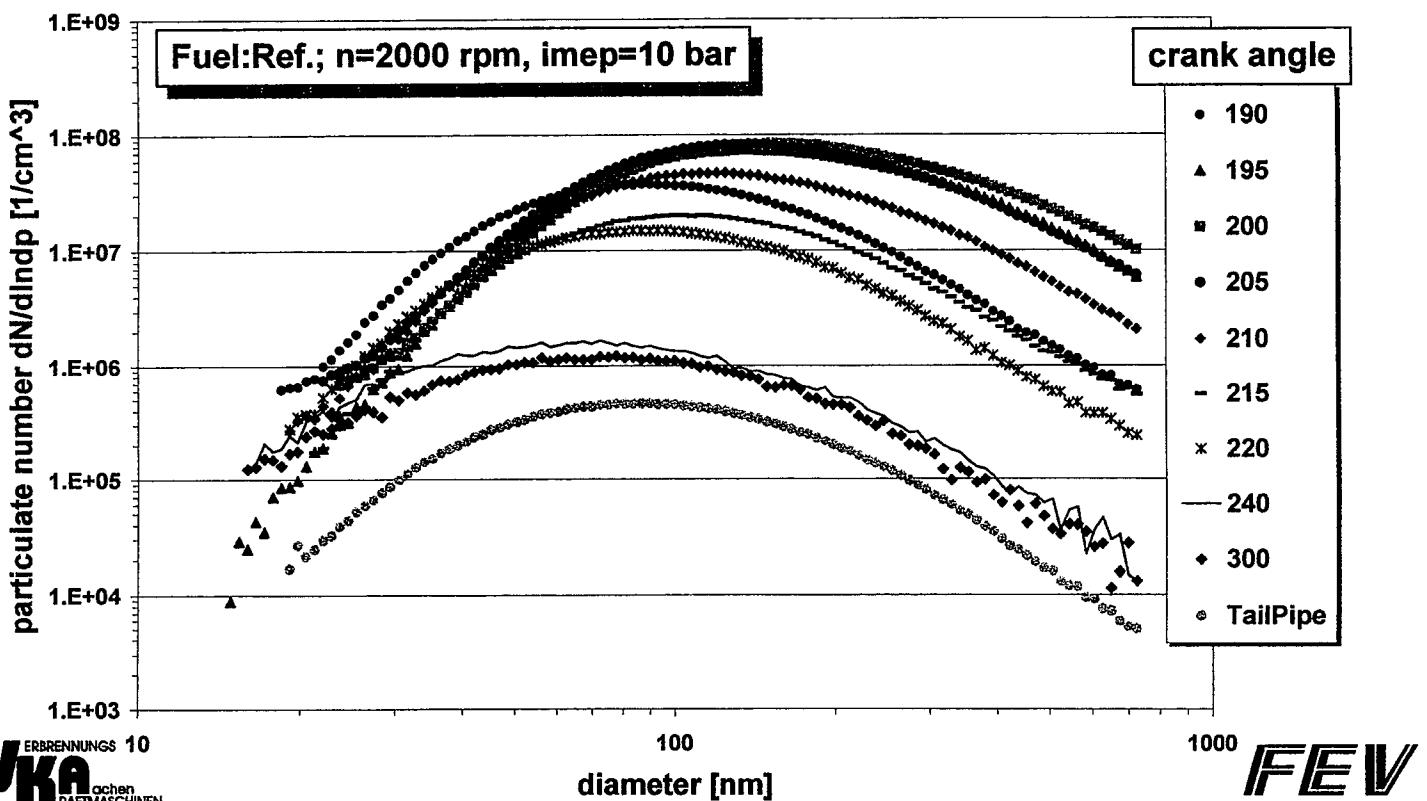

In-Cylinder Particle Size Distributions

Combustion of soot during the Expansion Phase

In-Cylinder Particle Size Distributions

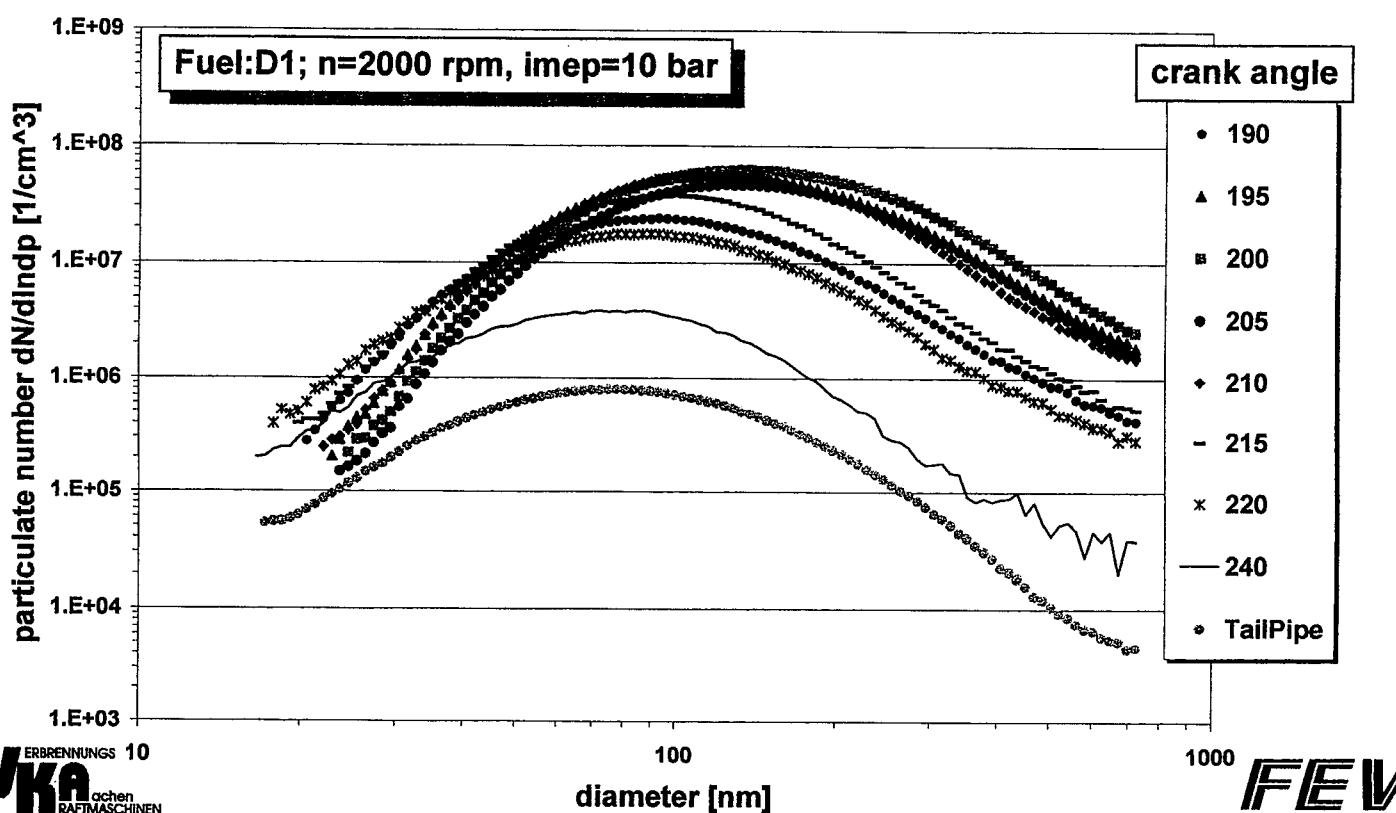

Combustion of soot during the Expansion Phase

- Influence of O₂ containing fuel on the particle size distribution in the cylinder

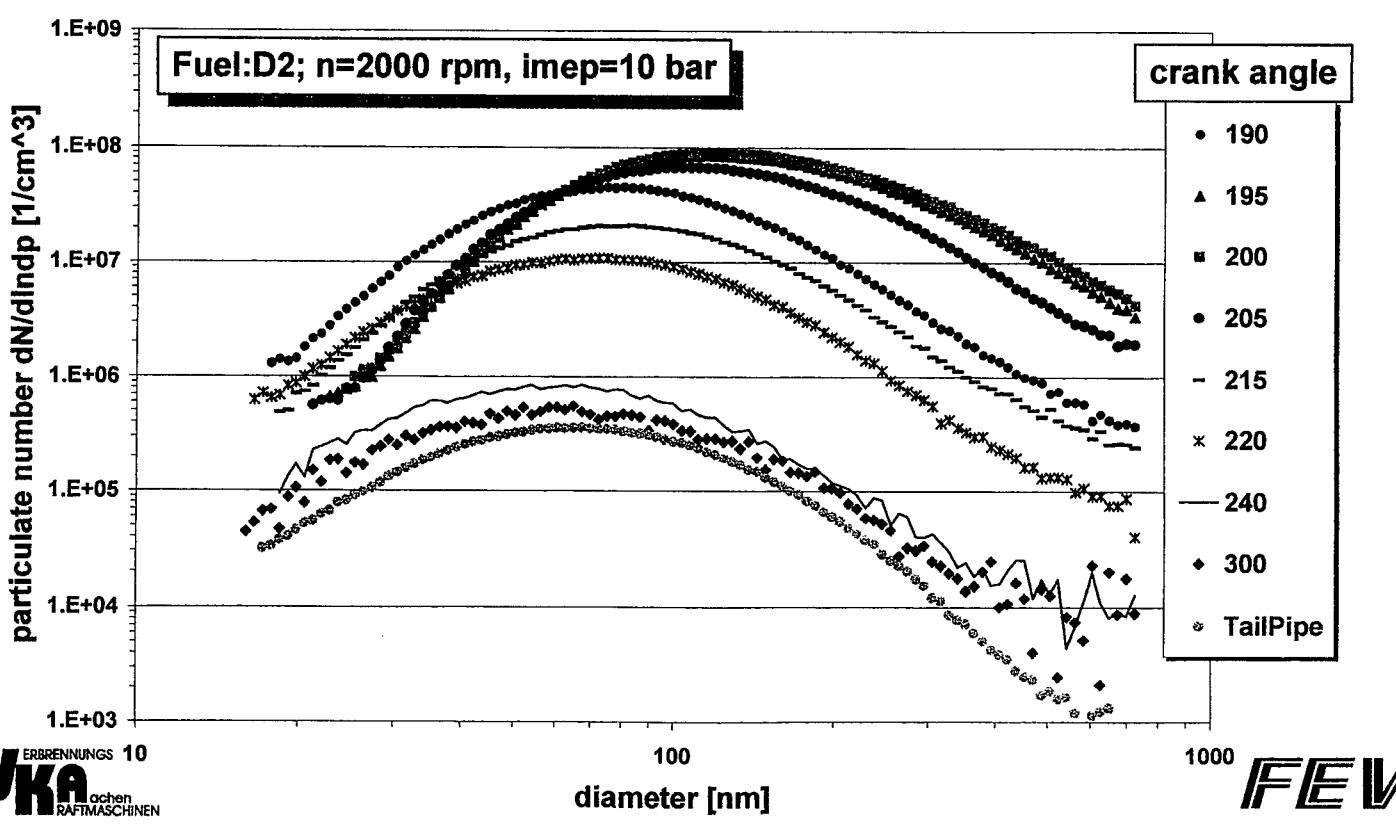

In-Cylinder Particle Size Distributions

Combustion of soot during the Expansion Phase

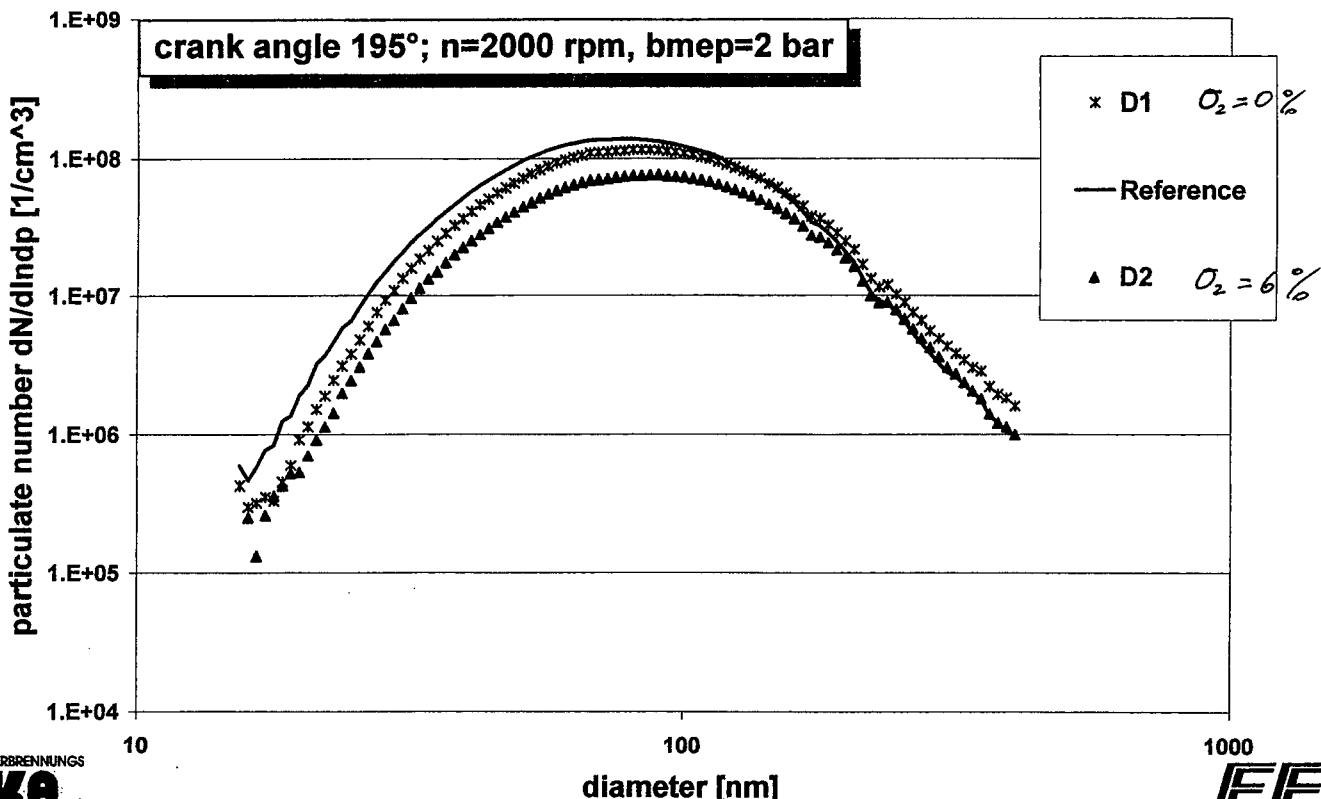

In-Cylinder Particle Size Distributions

Combustion of soot during the Expansion Phase

In-Cylinder Particle Size Distributions Comparison of Different Fuels

Conclusions

- Small particle formation during the injection and first combustion phase
- Particle number maximum at the end of the combustion phase
- Particle oxidation significant between about 210 °CA and 260 °CA (expansion phase)
- Primarily oxidation of "large" particles
- Increase of "small" particles during the particle oxidation phase at low load
- In-cylinder particle size distribution for > 260 °CA nearly equal to engine out emissions
- O₂ containing fuels reduce the particle number in the cylinder
