 - Regulated and non-regulated emissions
 - Particulate mass and numbers
 - Toxicology
- Conclusions

Objective

Characterisation of exhaust emissions with biodiesel and Diesel Particulate Filter on a HD Euro III engine:

- Transient tests
- Regulated and non-regulated emissions
- Particulate mass and numbers
- Toxicology

Content

- Objective
- Test program
- Results
 - Regulated and non-regulated emissions
 - Particulate mass and numbers
 - Toxicology
- Conclusions

Test set-up

Engine:

- DAF XE355 HD diesel engine
- 355 kW
- Euro III emissions level
NOx < 5, PM < 0.10 g/kWh

Test cell:

- Transient engine dyno
- CVS with full flow dilution tunnel

Test set-up

Fuels:

B0 (EN590)

B0 + c-DPF

B5

B10

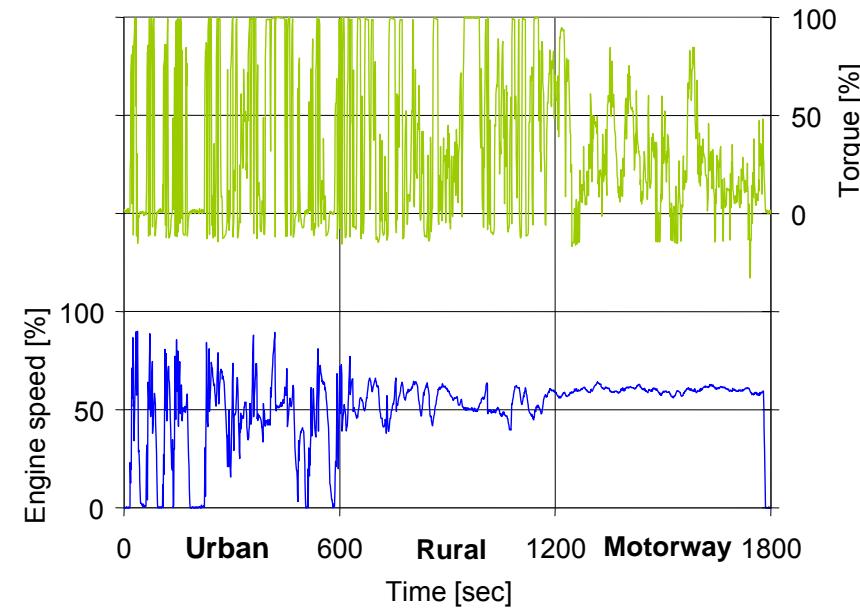

B20

B100

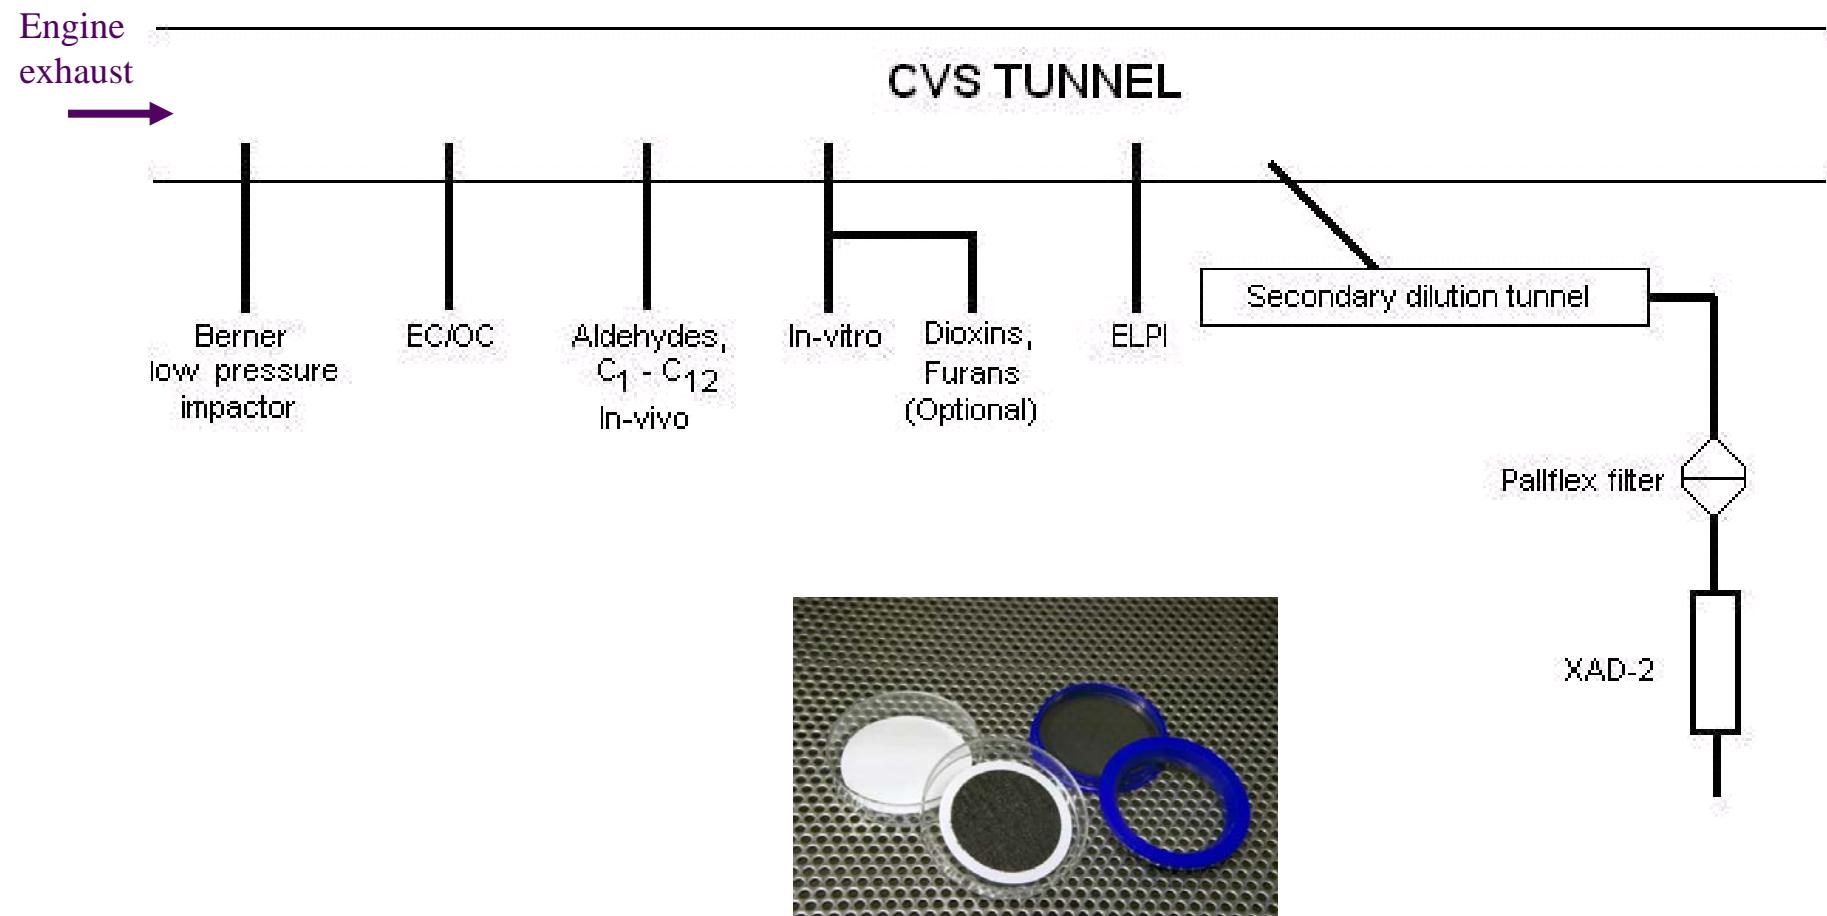

PPO

Test cycle:

European Transient Cycle
(ETC)

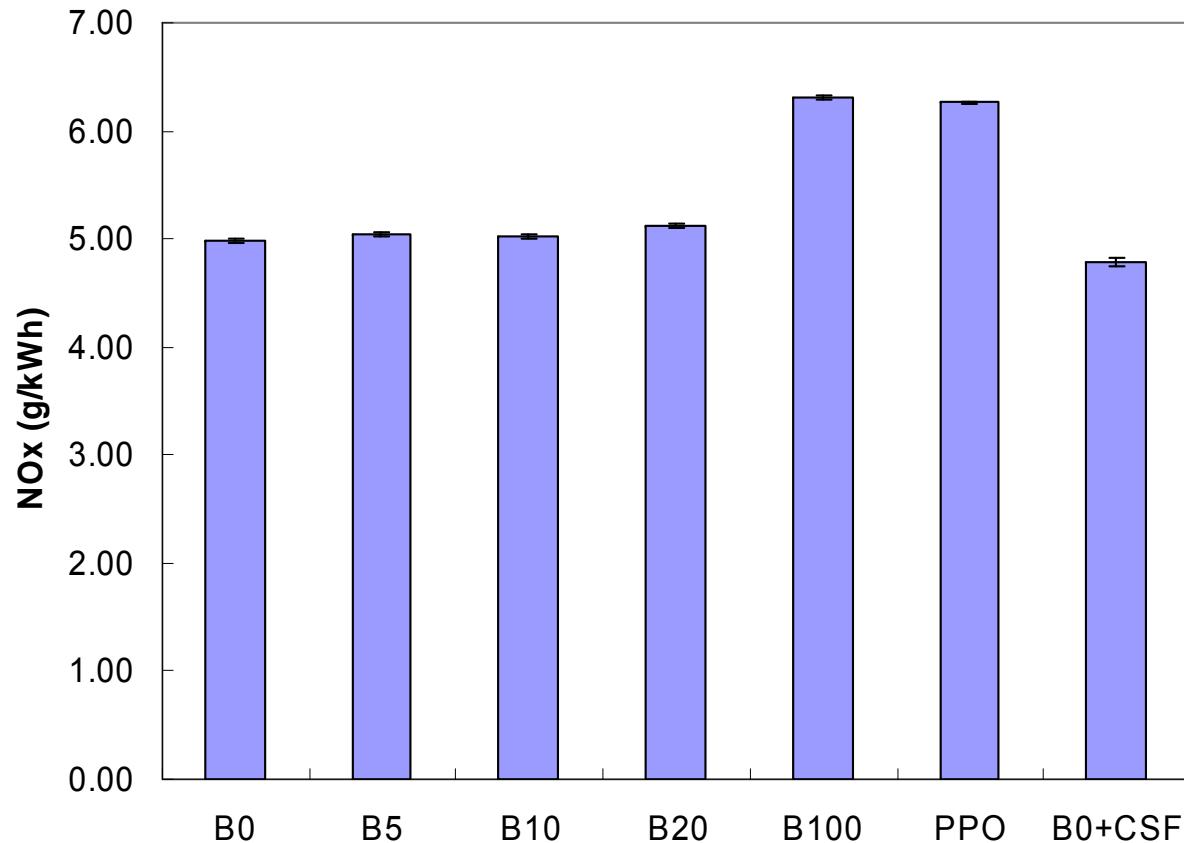

Test set up - sample collection

Content

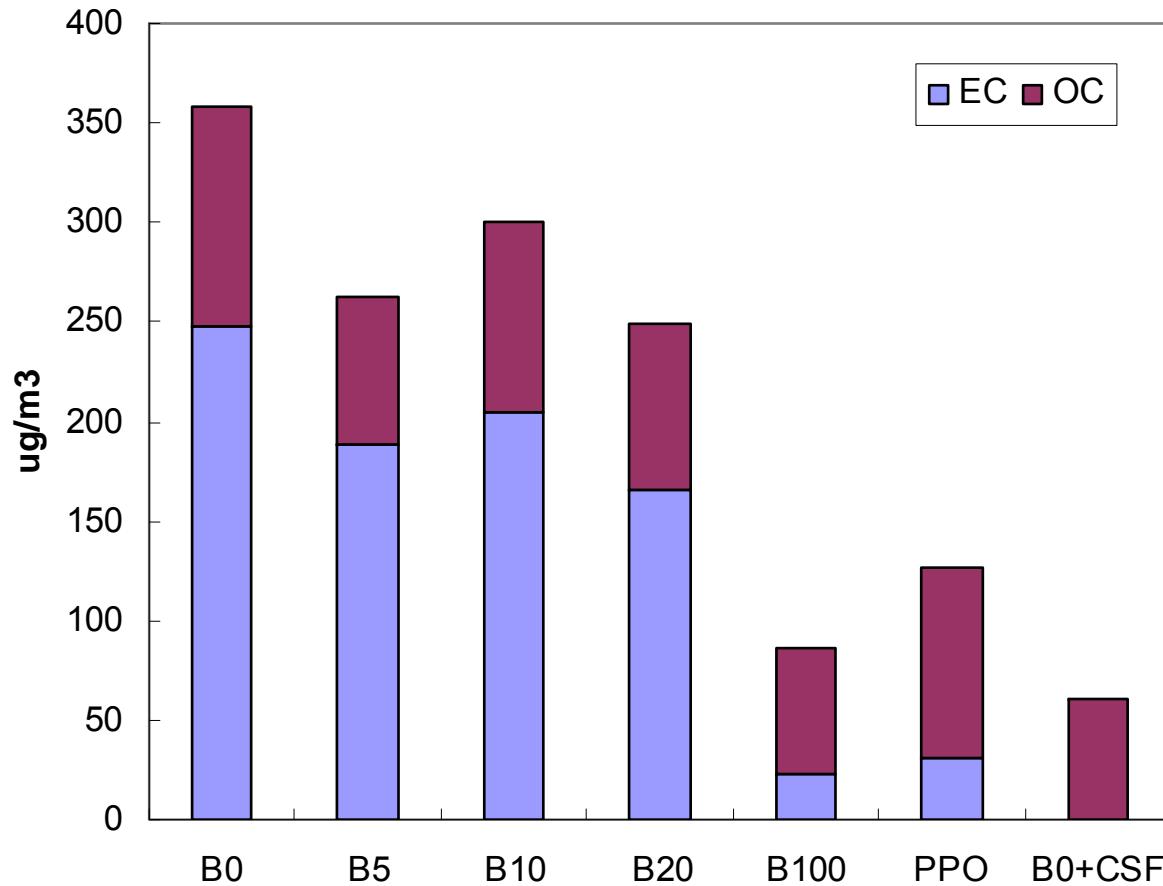

- Objective
- Test program
- Results
 - Regulated and non-regulated emissions
 - Particulate mass and numbers
 - Toxicology
- Conclusions

Results - NOx

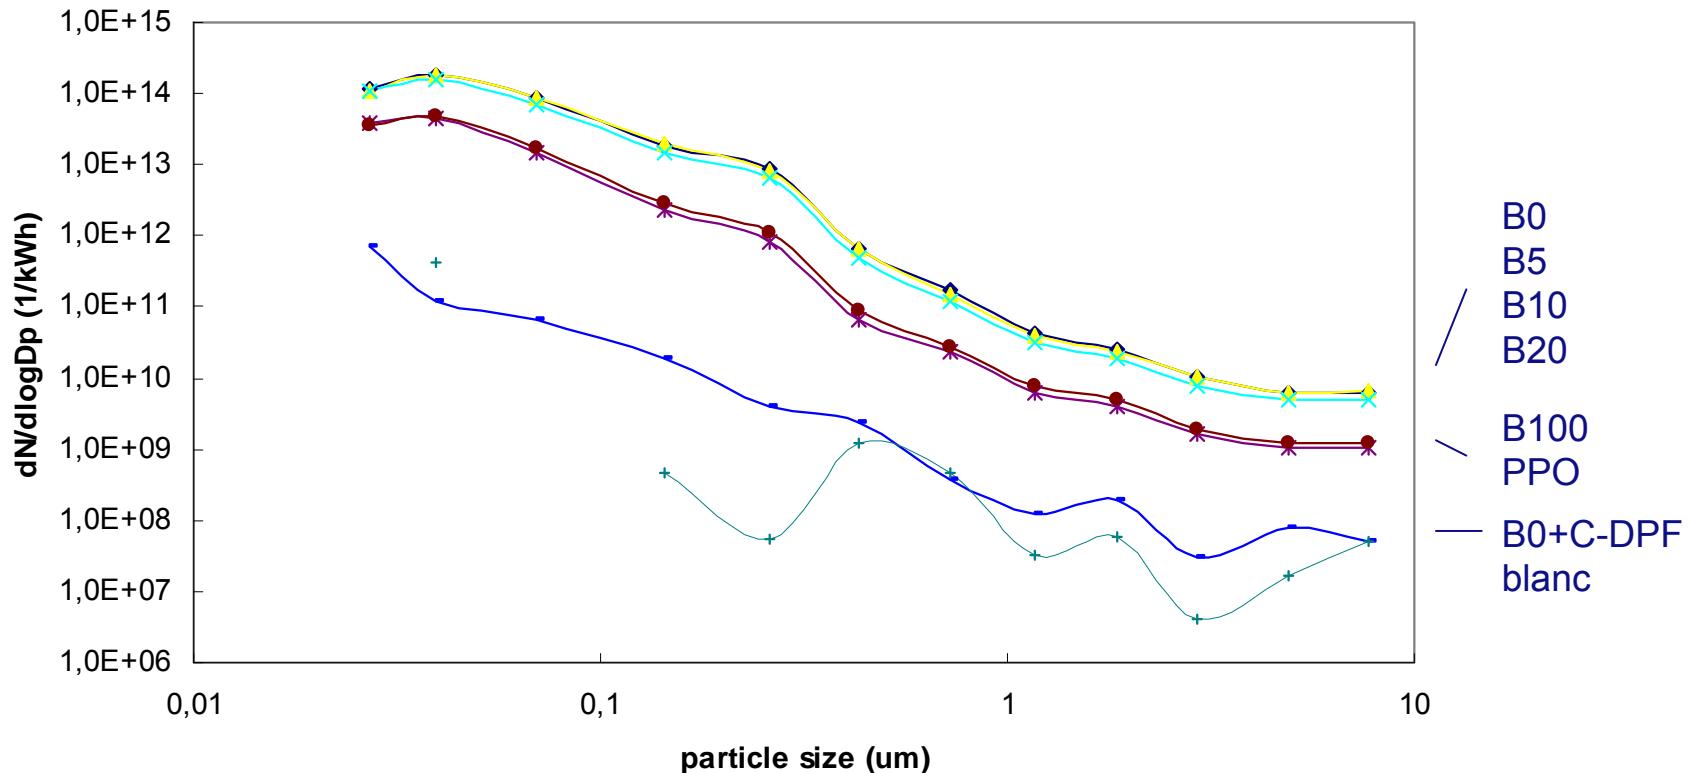

- B100 and PPO: 30% increase

Results - Particles

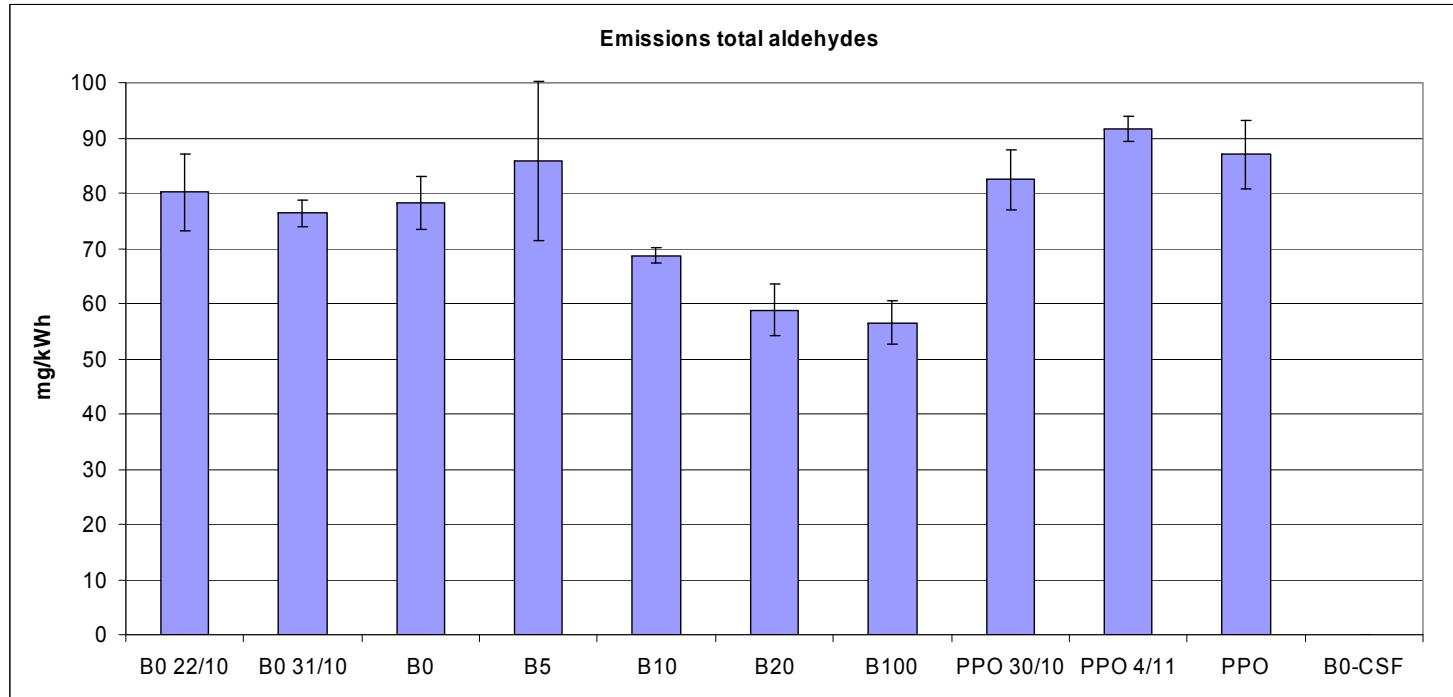

- Particulate mass reduction due to reduction Elementary Carbon

Results - Particle numbers

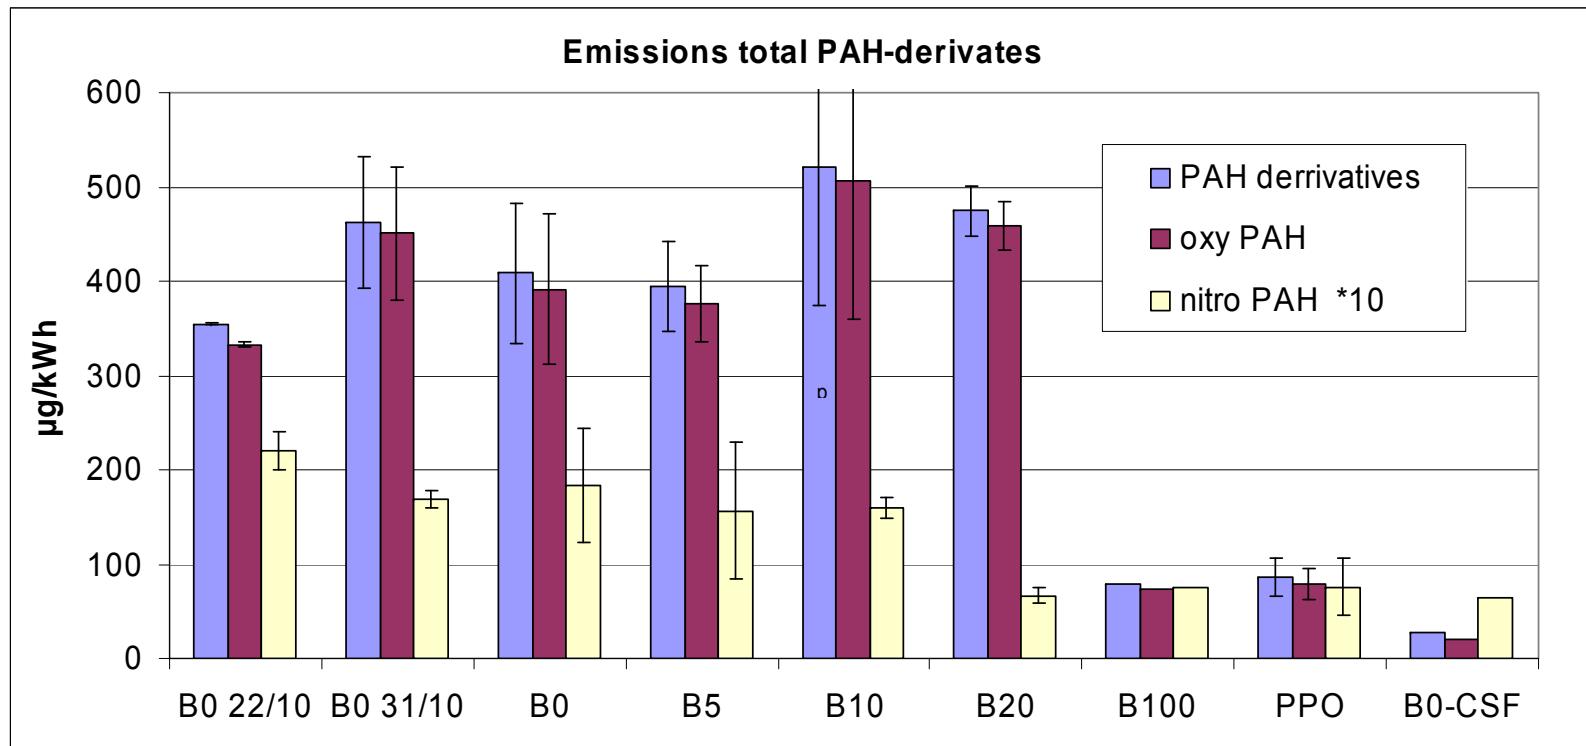

- B100 and PPO: reduction of 80% compared to baseline B0
- DPF: reduction >99%

Results – aldehydes

- Up to about 25% reduction with B100

Results - PAH, oxy-PAH, nitro-PAH

DPF or B100, PPO compared to B0 (no DPF):

- PAH, oxy-PAH decrease proportional with PM mass
- nitro-PAH: smaller reduction

Content

- Objective
- Test program
- Results
 - Regulated and non-regulated emissions
 - Particulate mass and numbers
 - Toxicology
- Conclusions

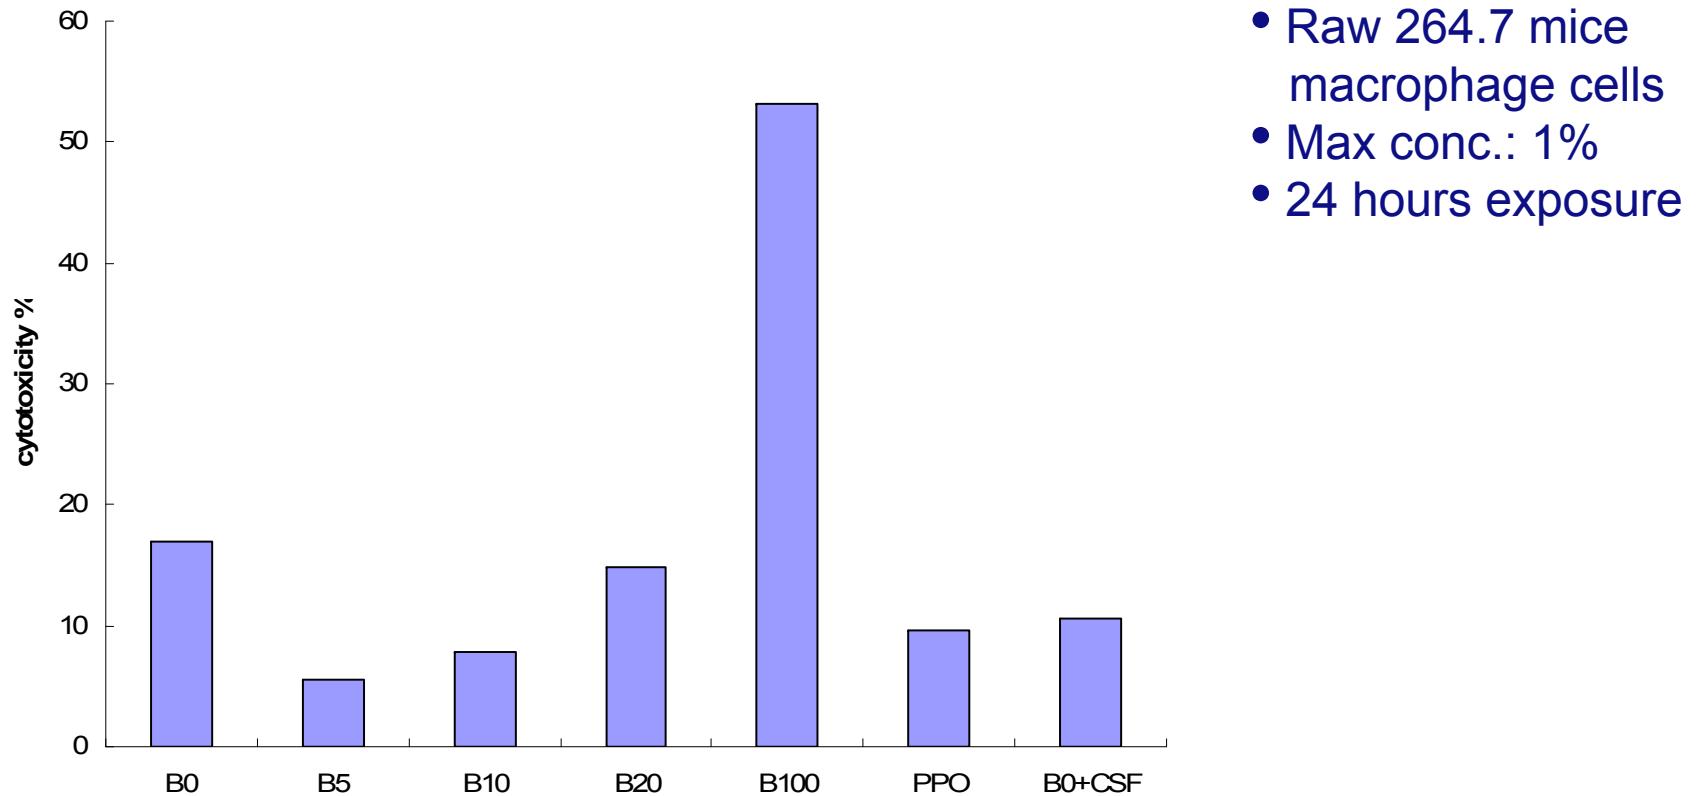

Results - Toxicology

From PM filter extract:

- Cytotoxicity
 - LDH
- Oxidative stress
 - Oxidative potential
 - HO-1 expression
- Mutagenicity/genotoxicity
 - Ames; TA98, YG1024
 - Comet
 - Micronucleus

Preliminary results with exposure chamber (not included)

Cytotoxicity - LDH

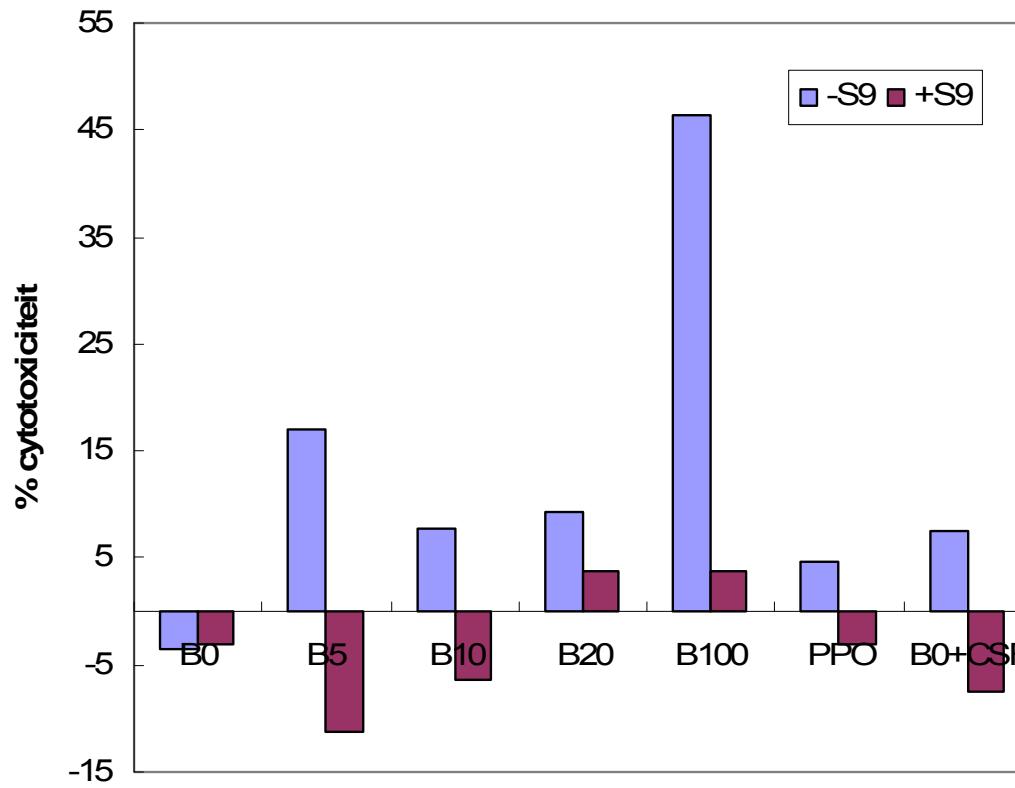

- Raw 264.7 mice macrophage cells
- Max conc.: 1%
- 24 hours exposure

- Only B100 gives a significance increase

Micronucleus test

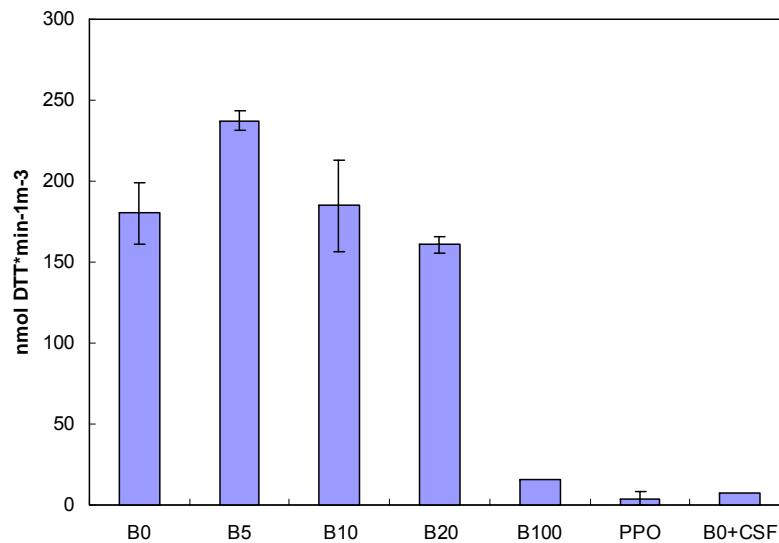

- Raw 264.7 mice macrophage cells
- 4 hours exposure

- Proliferation as a measure for cytotoxicity
- B100: increase in cytotoxicity, only -S9

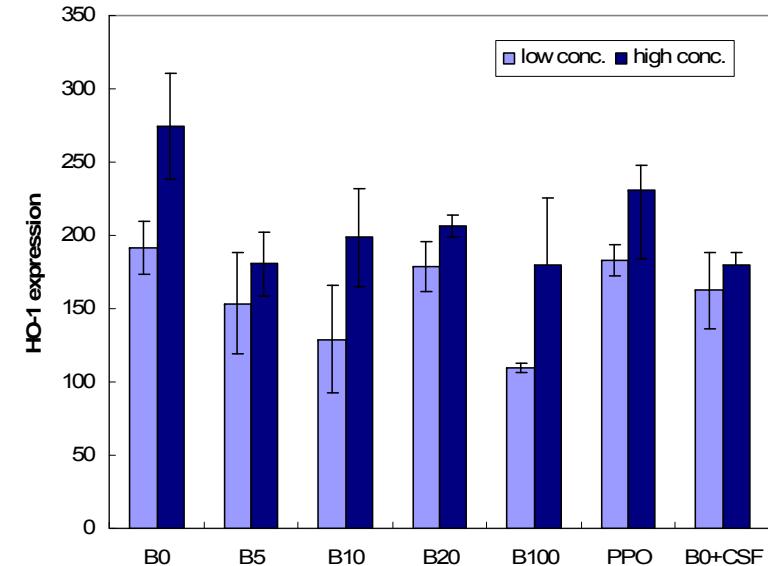

Oxidative stress

Oxidative potential DTT assay

B100, PPO, DPF compared to B0:
• > 95% decrease with DTT assay

Hemeoxygenase (HO-1) expression

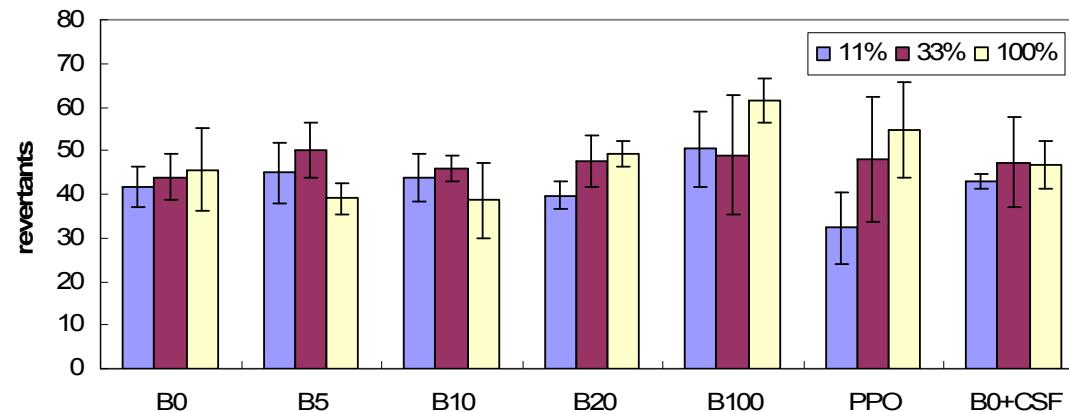

- Dose response for HO-1
- No difference in response for different fuels and DPF

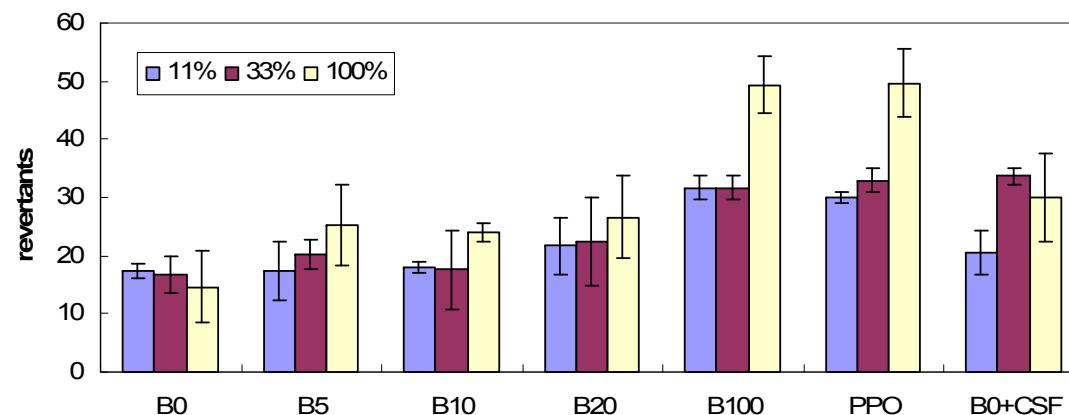

Mutagenicity/genotoxicity

Ames – TA98, YG1024

TA98, -S9

YG1024, -S9

- Significant effect for YG1024 with B100 and PPO
- Micronucleus test and Comet assay are negative

Summary

Effects per m³ exhaust or kWh compared to B0

	B100	PPO	B0+C-DPF
PM number	↓ 80%	↓ 80%	↓ >99%
PM mass	↓ 80%	↓ 60%	↓ >99%
NOx	↑ 30%	↑ 30%	~
PAH, oxy-PAH	↓ 70%	↓ 70%	↓ 90%
nitro-PAH	↓ 50%	↓ 50%	↓ 50%
Cytotoxicity (LDH, prolif.)	↑ 200%	~	~
Oxidative potential (DTT)	↓ 95%	↓ 95%	↓ 95%
HO-1 Hemeoxygenase	~	~	~
Mutagenicity: Ames – YG1024	↑ 60%	↑ 60%	~

Content

- Objective
- Test program
- Results
 - Regulated and non-regulated emissions
 - Particulate mass and numbers
 - Toxicology
- Conclusions

Conclusions

(1)

With Euro III heavy-duty engine:

	B100 and PPO	Wall-flow DPF
<ul style="list-style-type: none">• PM mass and number, PAH and oxy-PAH• nitro-PAH• NOx	<ul style="list-style-type: none">• 60% - 80% lower• ~50% lower• 30% higher	<ul style="list-style-type: none">• >90% lower• ~50% lower• equal (higher NO₂)
<u>PM fraction</u> <ul style="list-style-type: none">• Ames toxicity (mutagenicity)• oxidative stress• cytotoxicity	<ul style="list-style-type: none">• increased or equal• equal or lower• increased (B100)	<ul style="list-style-type: none">• equal• equal or lower

Conclusions

(2)

- ⇒ Evaluated biofuels show toxic effects in vitro
Further investigation recommended on chemical compounds that cause toxic effects
- ⇒ PM mass might not adequately reflect health effects of engine particulates
- ⇒ Recommendation to carry out more biological tests on engine exhaust (both gas and particulate phase)
