

**FOCUS Event – 20<sup>st</sup> ETH-NPC, June 16<sup>th</sup>, 2016**

# **DPF Inspection & Maintenance Methodology and Practice**

**Thomas W. Lutz**

**Maintenance** must be a periodic routine  
**Emission control** must become part of  
**maintenance**

→ Guarantees emission stability

→ Reduces overall costs

(by preventive repair, avoidance of operation interruptions...)

**Engine life and emission stability  
depend mainly on maintenance**

# Technical Requirements

- The vehicles are equipped with **certified filters** ( $\eta > 97\%$ ) and **wireless dataloggers**
- Certified **PN** (plus **CO**) **measurement devices**, portable, low cost and highly sensitive are **available**
- The **obligation** for periodical maintenance of emission relevant components, particle emission checks and documentation is **defined by a mandatory regulation**

# Potential of PN-Measurement

- Fast, handheld, accurate PN-measurement for:
  - Fleet maintenance and control
  - Roadside measurement
  - Official periodic emission checks
- Verify filter efficiency
- Detect small repairable DPF defects
- Indicate the need for filter exchange
- Detect engine malfunctions

# Portable Particle Emission Analyser

Condensation nucleus  
counter by TSI - NPET

Diffusion charging  
by TESTO - PEPA

# Can small failures be detected by PN at low idle ?

1 hole (0.5%)

5 holes (2.7%)

17 holes (9.3%)

41 holes (22.5%)

Completely (100%)

Source: Yamada, ETH-NPC 2015

# PN Increase vs. DPF Damage

Measured at low idle

Source: Yamada, ETH-NPC 2015

# I&M Organization

Run by:

**Test-only-stations**

- Authorities
- Authorized private organizations

**Test+repair-stations/shops**

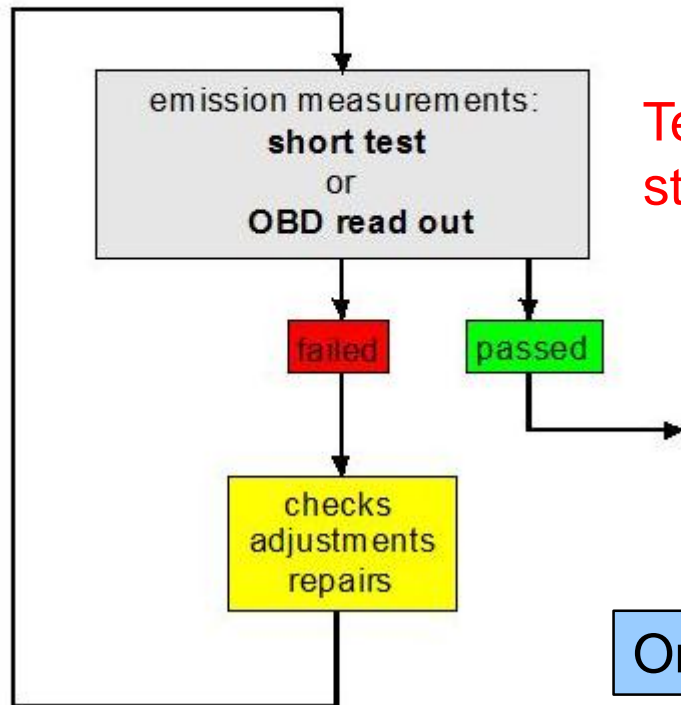

- Private workshops
- Users/fleet owners

**Supervision on-road/on-sites**      **Authorities**

# General I&M Strategies

## EFFECTIVENESS TEST OF EMISSION CONTROL SYSTEM

Test-only-  
stations

Test+repair-  
stations/shops

## PERIODIC EMISSION CONTROL SYSTEM MAINTENANCE

On-road (on-site) supervision test

# **I&M Concept Elements (1)**

**(to be defined)**

- **Vehicle categories liable to I&M**
- **I&M concept**
- **I&M procedures:**
  - tests
  - minimum maintenance
- **I&M intervalls**
- **Quality criteria for I&M performers:**
  - personnel
  - equipment
- **Certification of I&M performers**

## I&M Concept Elements (2)

- **Costs**
- **Data collection / individual documentation**
- **Quality control of I&M performers:** e.g. test equipment  
(periodical calibration)
- **Enforcement by on-road tests:**
  - procedure
  - crew training
  - equipment
  - financing
  - fines

etc.

# Typical I&M Procedure - Checks

- ① Regular inspection (every x month, *authorized institution*) (e.g. busses)
- ② Periodical maintenance of emission relevant components (*user, workshop*) (e.g. NRMM CH)
- ③ Supervision on-road (on-site) (*authorities*)

# Regular Inspection – Inspection Scope

①

- **Identification of the vehicle**
- **Measurement of PN at low idle (end pipe)**
  - PN < 100'000/cc → filter system OK
  - PN > 1'000'000/cc → filter or engine failure
- ▶ The operator of the vehicle is obligated to a regular engine and filter system maintenance procedure and a retest by an authorized institution

# Typical I&M Procedure - Checks

- ① Regular inspection (every x month, *authorized institution*) (e.g. busses)
- ② Periodical maintenance of emission relevant components (***user, workshop***) (e.g. NRMM CH)
- ③ Supervision on-road (on-site) (*authorities*)

# Maintenance of Emission Relevant Components: Procedure

②

- **Visual Checks:**
  - tightness of all systems
  - oil and soot deposits in the exhaust pipe
  - signs of overheating of the filter housing
- **Maintenance** of engine, filter system and crank case ventilation (in case of a closed version), corresponding to the instructions of the manufacturer
- **Data analysis** (wireless datalogger), e.g.:
  - too high backpressures (when and where on the route)
  - temperatures (e.g. low idle phases)
- **Cleaning of filter if necessary**, → the cleaned filter has to be checked by a PN measurement at low idle (end pipe)

# Maintenance of Emission Relevant Components: Procedure (cont.)

- ***Determination of filter efficiency***

- ▶ If the efficiency is below 90% and the PN emission is above the allowed limit:

- ***Visual check*** of the filter for damages (if less than 10%: → repair, otherwise replacement)
- If a ***bad engine condition*** is assumed: measurement of PN or opacity before filter at free acceleration and determination of the k-value, ev. oil analysis
- ***DOC*** (CRT systems): CO conversion measurement: If necessary, cleaning of DOC or replacement
- ***Confirmation*** in the inspection document

# Determination of Filter Efficiency

The filter masks the engine. Measurement upstream and downstream is needed to get information about engine raw emission and filter efficiency

PN1 before the filter determines the emission status of the engine itself, eventual failures, leakages, deterioration, aging

Filtration efficiency:

$$\eta = (PN1 - PN2) / PN1 \cdot 100 [\%]$$

# Repair Small Failures by Ceramic Cement

# DOC Light-off Test During Cooling down at Idle

Source: BFH

# Filter Monitoring System (FMS): Elements

Source: Paul Nöthiger Electronic

# Store Data

- On-board memory
- Server database
- Download data from memory: (**password protected**)
  - local: USB, WLAN, Bluetooth
  - remote: GSM (GPRS)

**GSM** = General System for Mobile Communication

Source: Paul Nöthiger Electronic

# Evaluation

- Statistics of DPF and vehicle operation
- Separation of operating hours and idle time
- Real time display and stored data analysis
- Trends of temperature and back pressure (normal, unusual)
- Comparison of vehicles and filters
- Prediction for filter cleaning and other maintenance needs

Source: Paul Nöthiger Electronic

# Trend Analysis

Background informations about longterm trends of filter loading and exhaust gas temperatures,  
 - allows conclusion on normal or unusual operation of filter and engine

Source: Paul Nöthiger Electronic

# Fleet Overview Report

Source: Paul Nöthiger Electronic

**Back pressure – weekly 95%-percentiles**

# Typical I&M Procedure - Checks

- ① Regular inspection (every x month, *authorized institution*) (e.g. busses)
- ② Periodical maintenance of emission relevant components (*user, workshop*) (e.g. NRMM CH)
- ③ **Supervision on-road (on-site) (*authorities*)**

# Supervision Test – On-road / On-site

③

- Identification of the vehicle
- Measurement of PN at **low idle** (end pipe)
- If the limit of (*CH regulation*) **250'000 #/cm<sup>3</sup>** is exceeded:
  - ▶ then the operator of the vehicle is obliged to a regular engine and DPF system maintenance procedure and a retest by an authorized institution

# On-road Check

Santiago de Chile,  
July 2015

Equipment:  
**TSI-NPET**

# Individual Documentation

- Content:**
- Vehicle main data
  - (retrofit date)
  - low and high idle speed
  - (start of fuel delivery)
  - PN before and after filter at low idle
  - rubrics for inspection confirmations

# Conclusions

## The needs for the implementation of a consistent I&M strategy

### ➤ The instruments are ready:

- PN-measurements at low idle for DPF and engine control
- Filter monitoring with remote control (datalogging)
- DOC-conversion activity control is in the test phase (CRT systems)

**but**

### ➤ Regulations are needed

### ➤ Periodic independent checks are needed

### ➤ A documentation is needed (emission document on-board)

**Inspecting vehicles does not  
reduce pollution,  
MAINTAINING / REPAIRING  
them does**
