

# New-fit sulfur tolerant DPF solution to meet Iran's new emission legislation: a case study

Vahid Hosseini<sup>1</sup>, Mahdi Doozandegan<sup>1,2</sup>, Aidin Akbarzadeh<sup>3</sup>

1- **Mechanical Engineering Department, Sharif University of Technology, Tehran, Iran**

2- ASA, Official VERT office of Iran

3- Mayan Industrial & Manufacturing Co

21<sup>st</sup> ETH-Conference on Combustion Generated Nanoparticles  
June 19th – 22<sup>nd</sup> 2017, Zurich, Switzerland

# Table of content

- Background of particle pollution and DPF implementation in Tehran
- A novel OEM approach for Iran's applications
- RDE evaluation of the system with PEMS
- Durability runs
- DPF and DOC cleanup procedures
- Concluding remarks

# Background

# Pictures from Tehran

- Population: 8.5 million
- 4 million LDVs and motorcycles all gasoline and CNG
- 130,000 HDVs, all diesel

# History of legislations

- DPF subject was started in Iran in 2014
- Since then, there is a national legislation for **Euro IV+DPF** for new diesel vehicles starting Sep 2016
- Later on European OEMs lobbied for **Euro V EEV** to be added to legislation.
- There is a legislation for all public vehicles in 8 large Iranian cities (30+ million inhabitants) to be retrofitted to DPF
- There is a city council legislation in Tehran for soot purchasing scheme (paying more to contractors if they have filters on their diesel vehicles)

# Tehran DPF retrofit project

- Pilot tests are running since 2014 (10 buses, 6 technologies)
- 50 buses now retrofitted to filters
- The project move forward despite of technical obstacles and resistance of operators

awareness and outreach

Pilot tests, local conditions

new products are coming

# International events

**Inspection & Maintenance of Iran's Commercial Fleet, Current Vehicles & Future Vehicles with DPF, SCR, DOC, and EOBD**

کارگاه آموزش معاینه فنی زیست محیطی  
خودروهای دیزل تجاری برای کاربری شهری

An international workshop to gain European experiences for diesel PTI\*

**Venue**

**Date**

**Organizer**

**Sponsors**

**Sharif University of Technology, Tehran, Iran**  
دانشگاه صنعتی شریف - تهران - ایران

**Dec 14-15, 2016**  
چهارشنبه و پنجشنبه، ۲۴ و ۲۵ آذر ۹۵، ساعت ۸ صبح الی ۱۶

**UNESCO Chair in Water and Environment Management for Sustainable Cities**  
کرسی یونسکو در مدیریت آب و محیط زیست برای شهرهای پایدار

\*PTI: Periodic Test & Inspection

## Soot-free Tehran

**International workshop on solutions for eliminating diesel and gasoline emitted soot from urban air**

**Date:** September 7<sup>th</sup>, 2016  
**Venue:** Sharif University of Technology

Attendance is only by invitation  
Registration is free  
For registration and further information contact UNESCO chair office via email [unescochair@sharif.edu](mailto:unescochair@sharif.edu) or call +98-21-6616-4142

# سومین همایش ملی مدیریت آلودگی هوا و صدا

**۲۴ و ۲۵ دیماه ۱۳۹۳**  
**مرکز همایش های بین المللی صدا و سیما**

- پایش و اندازه گیری آلودگی هوا
- آلودگی هوای محیط های بسته شهری
- مدل سازی و پیش بینی آلودگی هوا
- راهکارهای کاهش آلودگی هوا
- ریزگردهای (هواویز) آلاینده هوا
- آموزش و فرهنگ سازی در مورد آلودگی هوا و صدا
- آلودگی صوتی

**AQM 2014**

**aqm.sharif.ir**

# A novel OEM approach for sulfur tolerant filters for Iran

# General Specification

Fuso Canter	
Engine model	4P10-8AT4
Engine volume	3 Liter
Engine output	110 kW
Max torque	370 N.m
Emission level	EURO V
Emission reduction technology	EGR+DPF

# DPF System and regeneration strategy

- Full flow silicon carbide DPF.
- The regeneration process is a quasi passive.
- Passive regeneration mechanism is DOC-CRT
- The active regeneration is a combination of early post injection, temporary EGR deactivation, and idle speed increase
- automatic and manual active regeneration

# Regeneration strategy

- DPF regeneration mechanism consists of 3 main sequential steps:

1- CRT is working when the fuel sulfur level is low

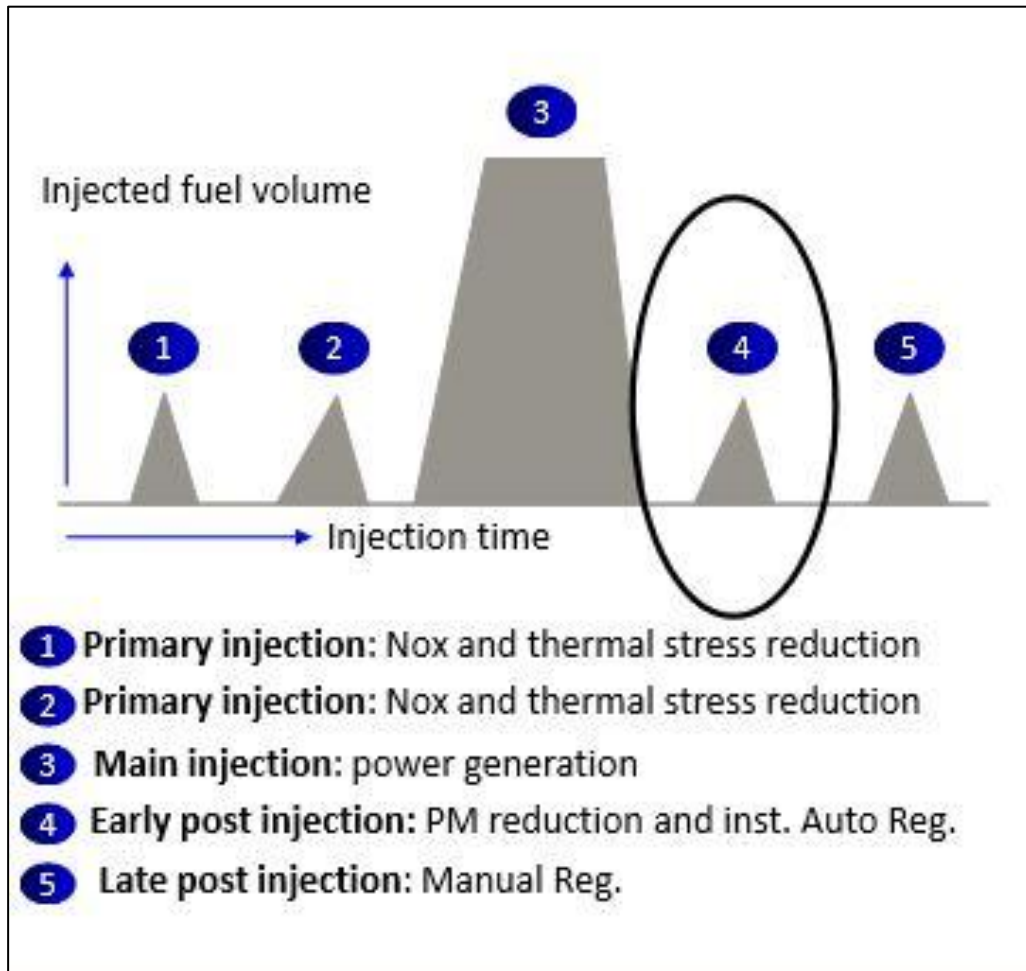

2- Instantaneous automatic regeneration when CRT is not fully working,

- o Early post injection
- o Temporary EGR deactivation
- o Temporary increase of idle speed from 600 rpm to 800 rpm

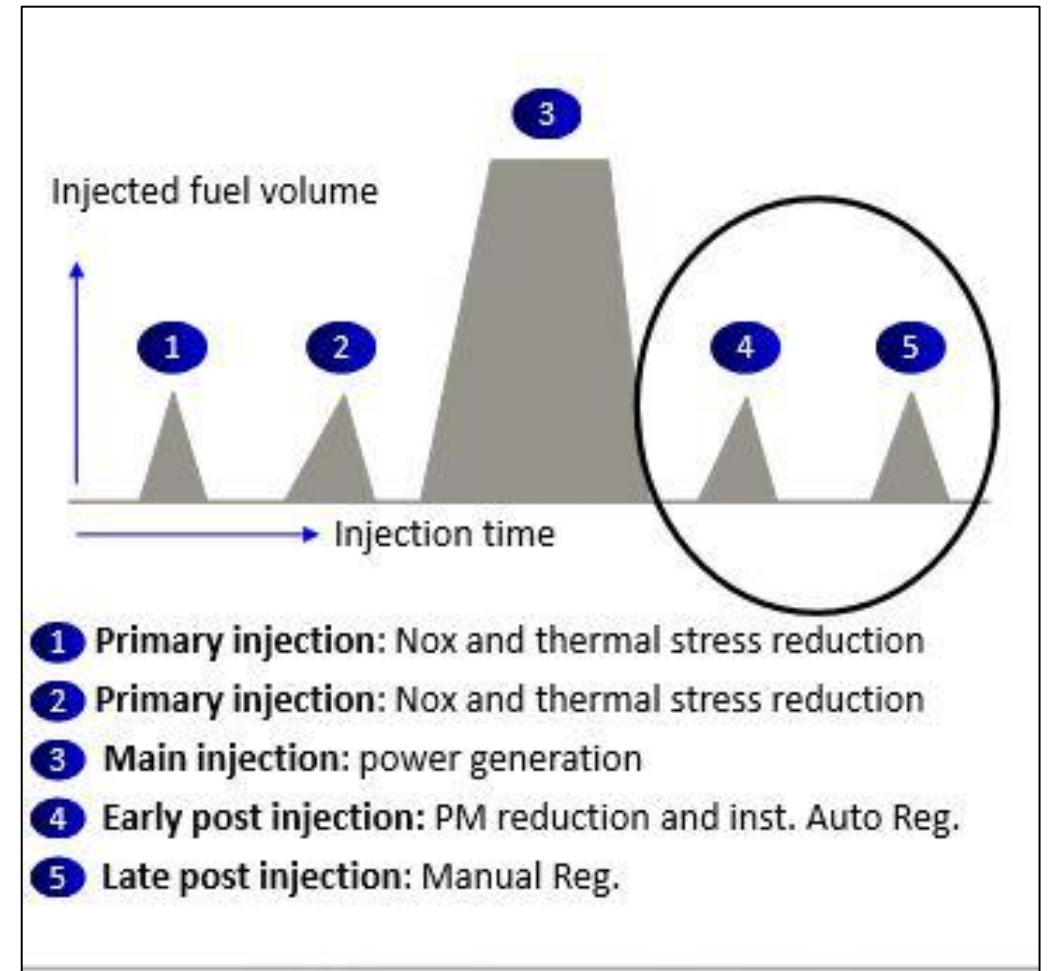

3- Manual Regeneration by the operator if there is still back pressure problem

- o Late post fuel injection

# Regeneration strategy

Automatic regeneration

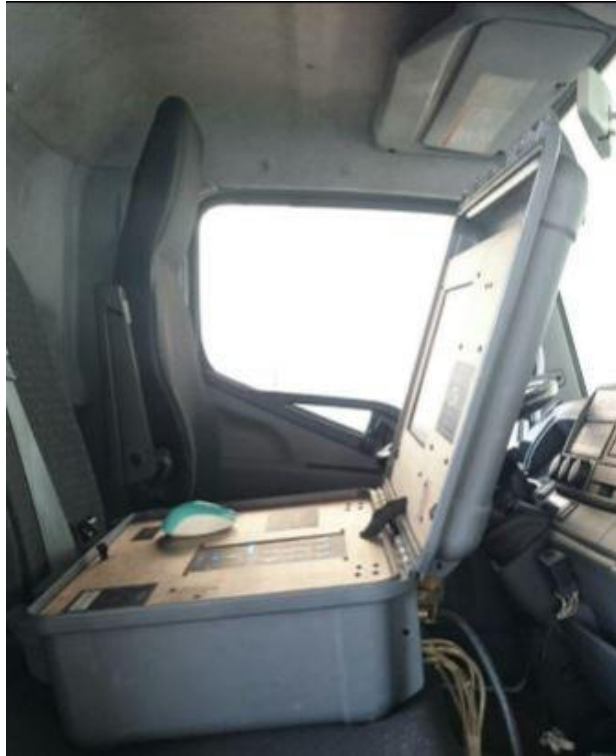

Manual regeneration

# RDE evaluation of the system with PEMS

# Instrumentation

 **matter aerosol**  
a **testo** company

# Test procedures

- Besides Iranian normal driving cycle, some steady- speed tests and half load points also were added to the test procedure.

## Steady-speed points

Stage	1	2	3	4	5	6	7	8
Gear	4 <sup>th</sup>	4 <sup>th</sup>	4 <sup>th</sup>	5 <sup>th</sup>	5 <sup>th</sup>	5 <sup>th</sup>	5 <sup>th</sup>	4 <sup>th</sup>
Vehicle speed	40	60	80	40	60	80	Max	40

## Half loads points

Stage	Time (s)	RPM	Load
9	30	2000	50%
10	30	2500	50%
11	30	3000	50%
12 Average	90	2000-3000	50%

## Iranian driving cycle

Vehicle category	Urban (0-50km/h)	Rural (50-75km/h)	Motorway (75km/h-)
M1, N1	45%	25%	30%
M2, N3	45%	25%	30%
M2, N3 (Class I, II or Class A)	70%	30%	-
N2	45%	25%	30%
N3	20%	25%	55%

Stage 16

Stage 13

Stage 14

Stage 15

# Sampling

- Sampling was done w and w/o DPF installed

**DPF system**

**Replaced pipe instead DPF**

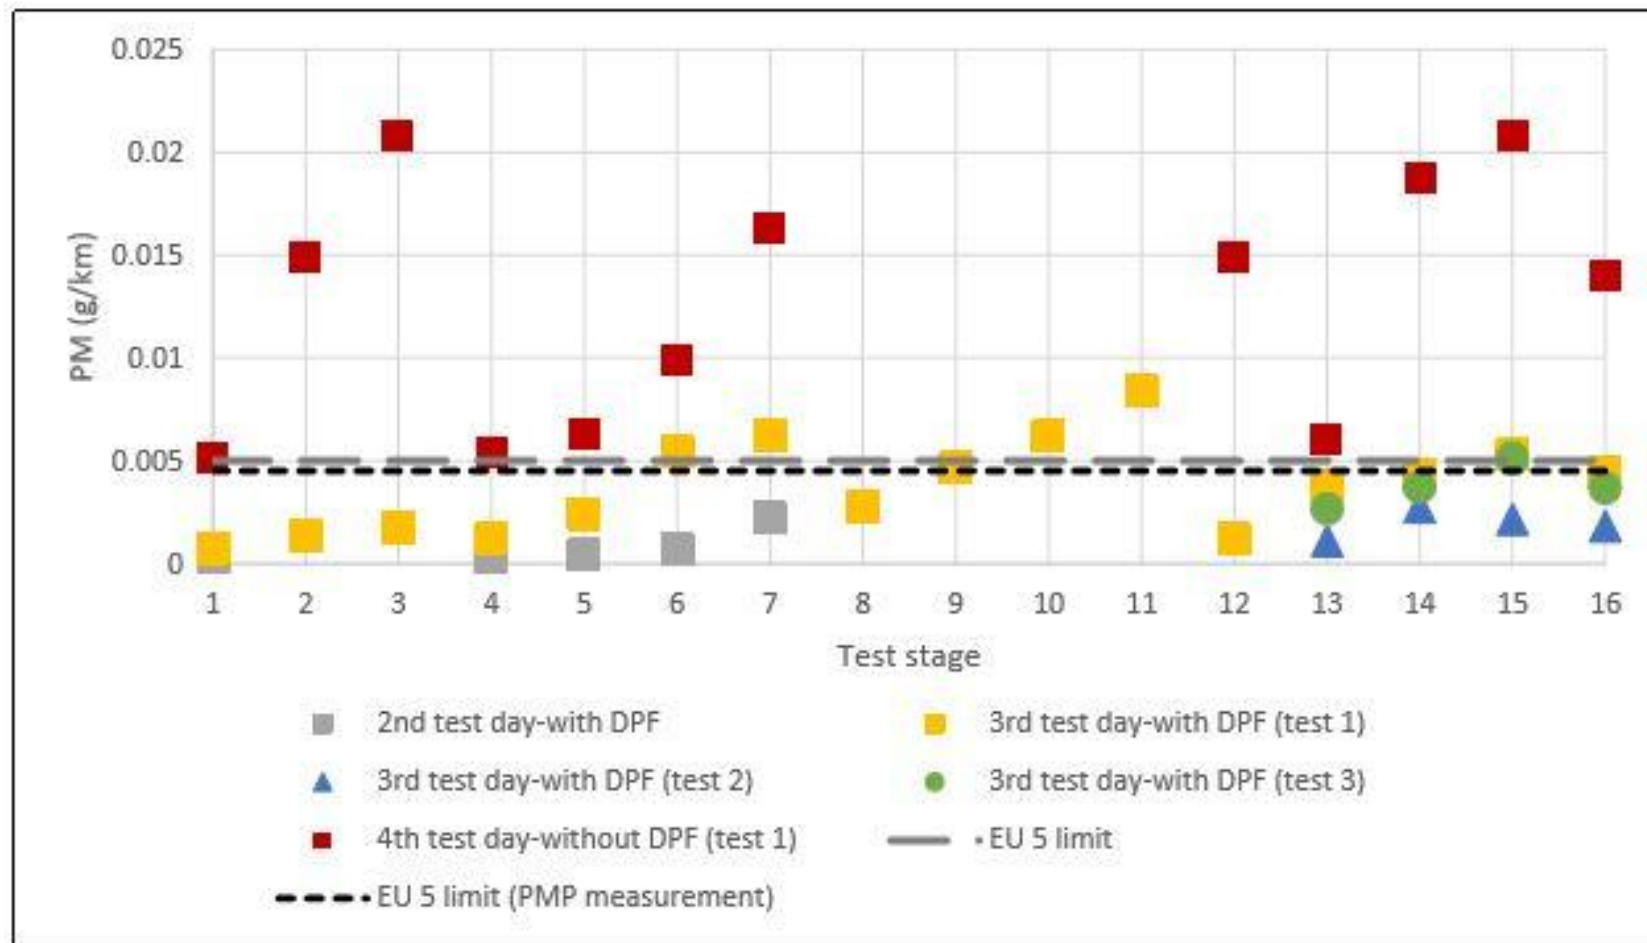

# Test route

Length = 100 km

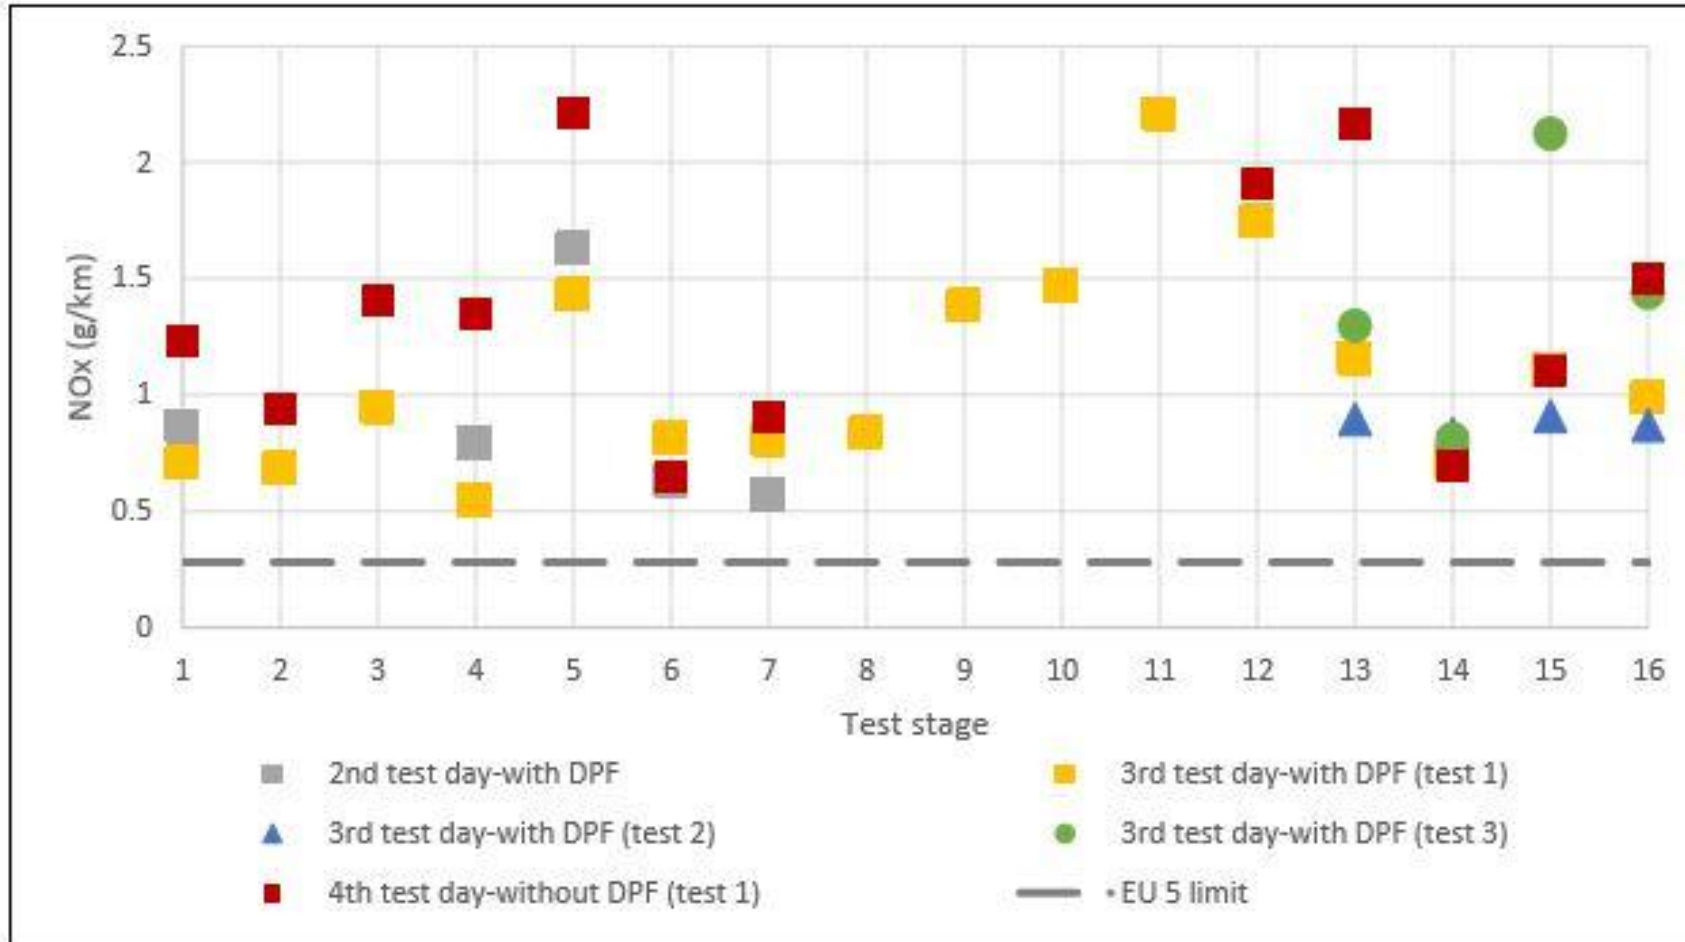

Elevation = 1200 meter above sea level

## PM results (g/km)

**Averaged values:**  
**With DPF: 0.003 g/km**  
**Without DPF: 0.0128 g/km**

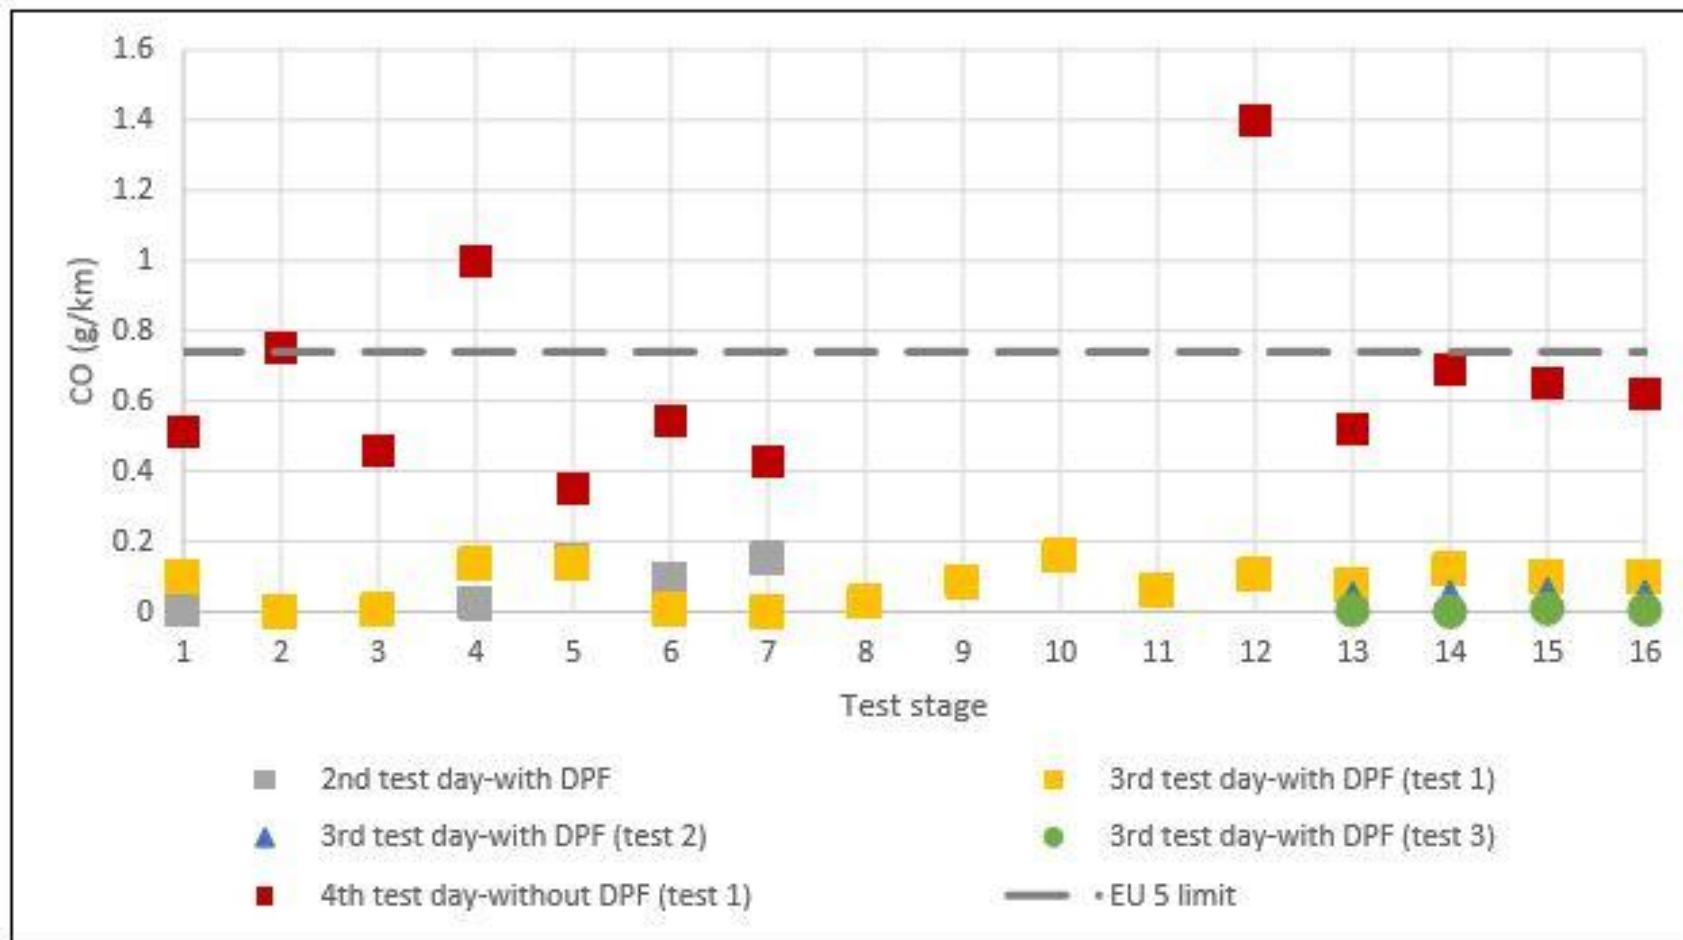

# NO<sub>x</sub> (g/km)

**With DPF: 1.08 g/km**  
**Without DPF: 1.34 g/km**

**Small reduction was observed in NO<sub>x</sub> values because of internal EGR which was caused by DPF back pressure**

# CO (g/km)

**With DPF: 0.07 g/km**  
**Without DPF: 0.66 g/km**

## PN measurement

- PN measurement was done at three different idle speeds

Engine speed (rpm)	600	2000	4000
PN concentration at DPF downstream (#/ccm)	4.25E+04	5.33E+04	3.20E+04
Average PN concentration at DPF upstream (#/ccm)	7.4E+07		

**PN \_ efficiency > 99%**

# Durability runs

# Durability test- basic information

- 50,000 km road test
- 2 trucks
- Duration of 4 months and 3 routes
- Various fuel sulfur content from 44 ppm to 8,180 ppm

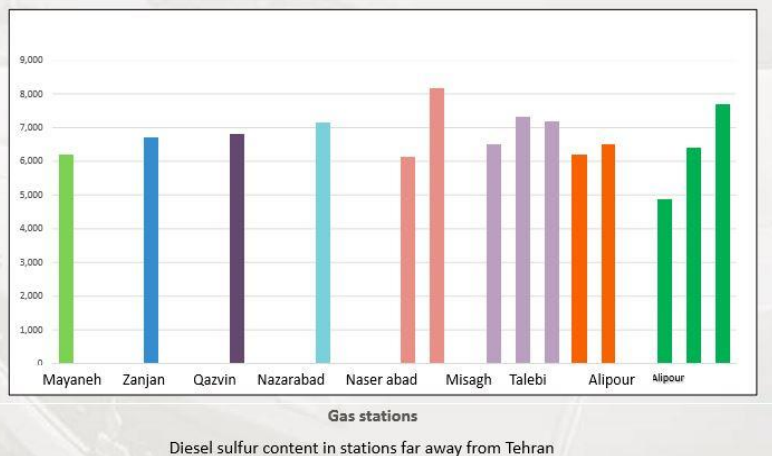

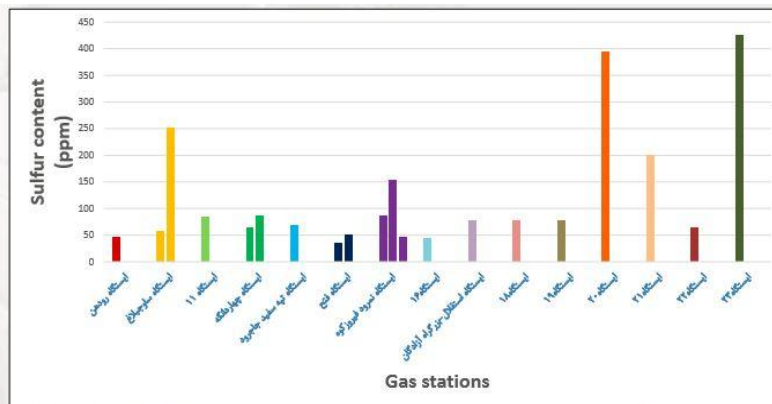

Test vehicle #1

Test vehicle #2

# Fuel Map (sulfur content)

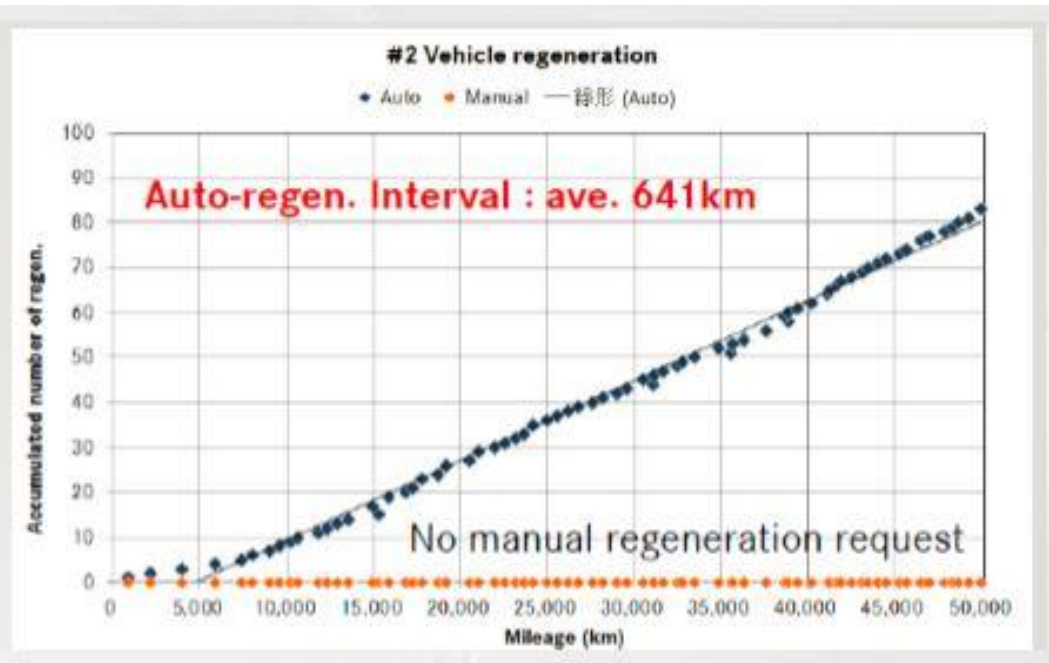

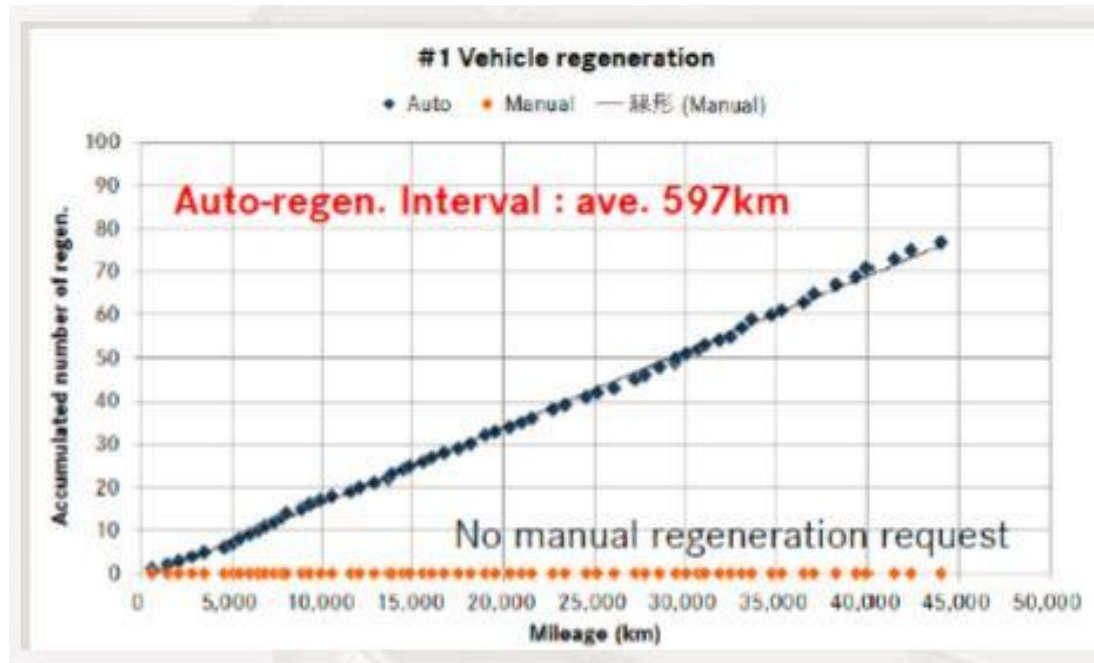

## Sulfur content

- Large cities < 50 ppm
- Roads and remote areas up to ~8000 ppm

# Durability results

- No manual regeneration was required within 50,000 km road test.
- As average, instantaneous automatic regeneration had been deployed every 600 km.
- This interval for instantaneous automatic regeneration is almost every 4,000 km, while operating with Euro IV diesel.

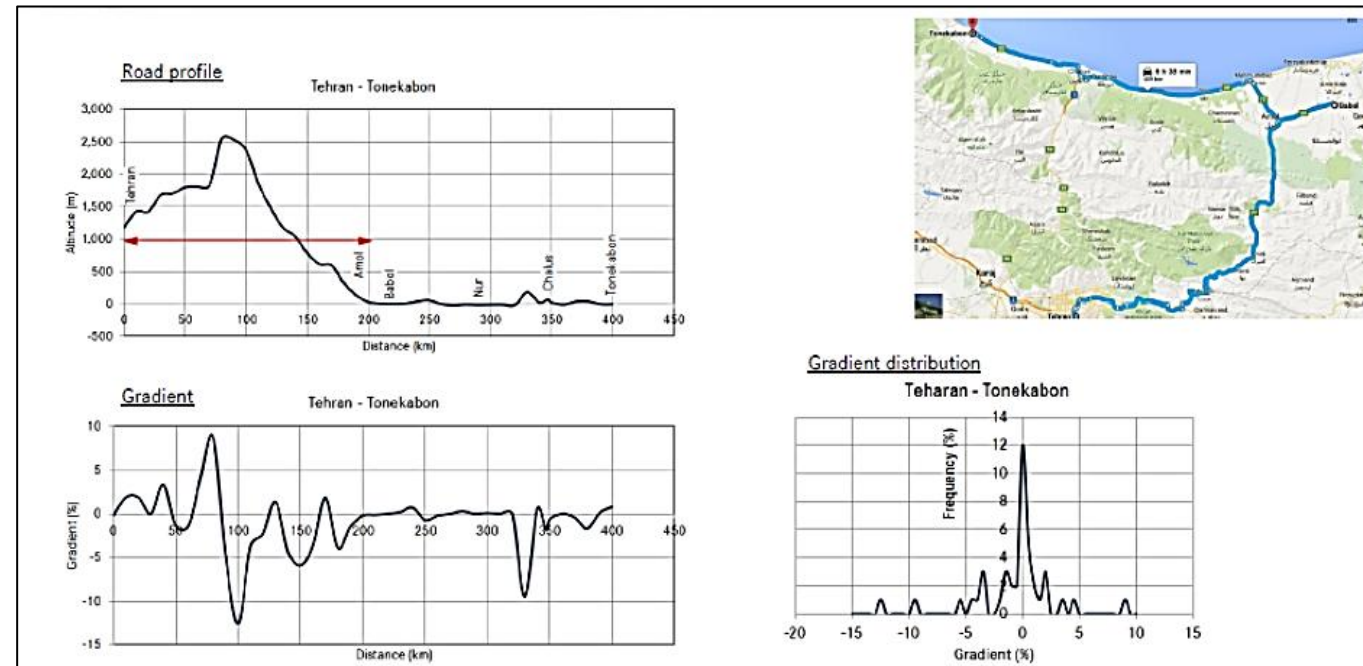

# Challenges due to high sulfur diesel fuel

- In brief, in spite of using of highest oil quality level i.e. API CJ4 which is recommended for DPF equipped engines, oil had degraded considerably due to high sulfur content.
- Higher backpressure operation as the result of fuel sulfur content (DOC deterioration), turbocharger cooling oil penetration into engine intake
- Several post fuel injection leads to engine lube oil dilution by diesel fuel and rapid oil deterioration
- Based on effect of high sulfur content, level of metal elements increased considerably that is a clear sign of high corrosion and wear of engine components.

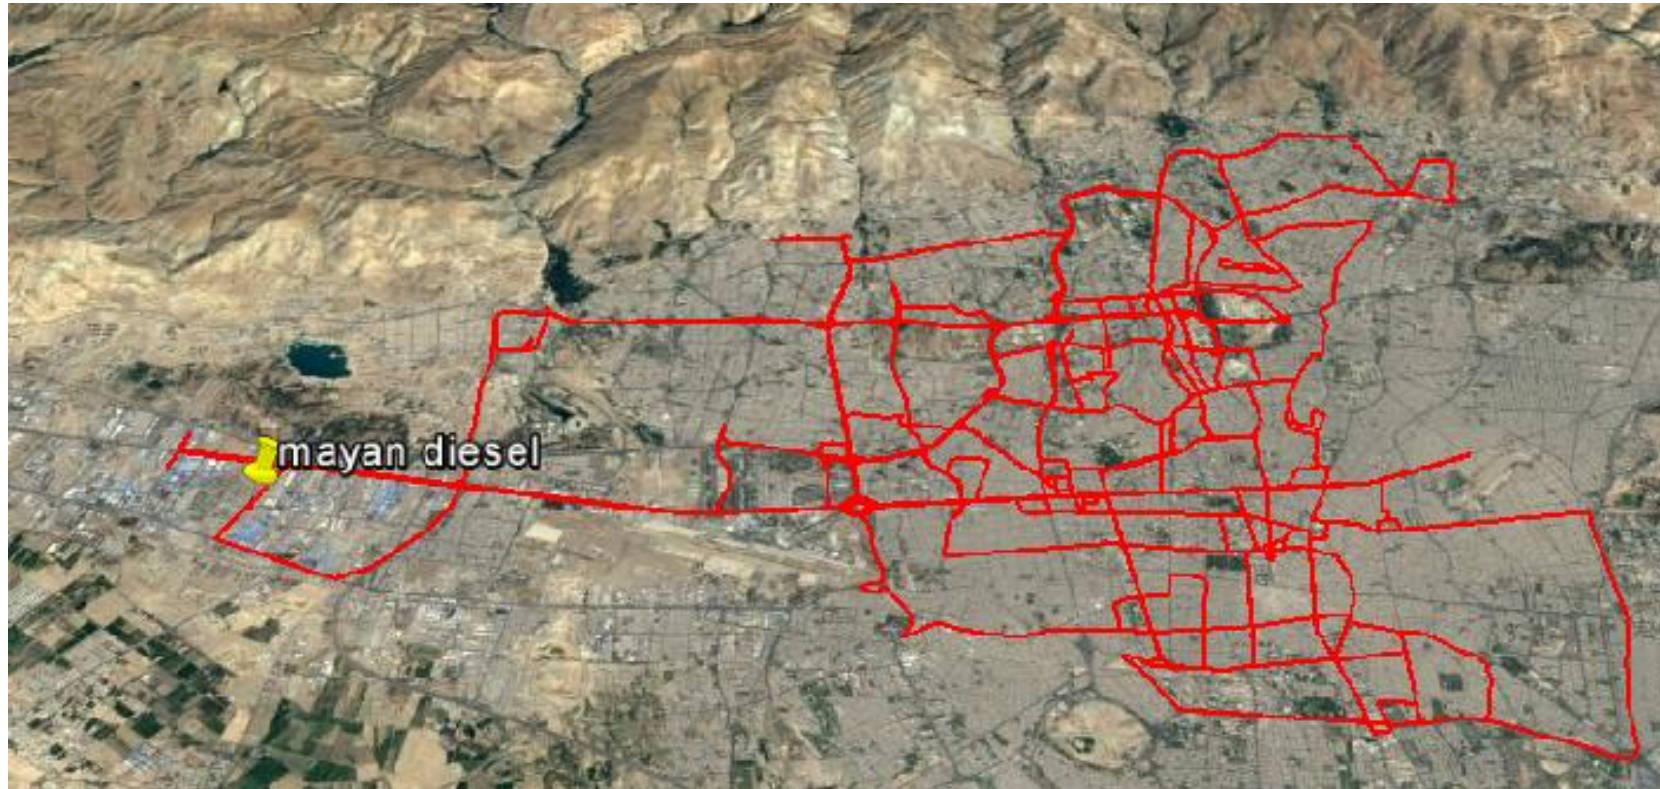

# Worst case scenario – 2<sup>nd</sup> round of road test

- Driving in dense city traffic jam with frequent start and stop and low speed.
- -Drivers are instructed to drive in very low vehicle speed and high gears to cause minimum engine speeds.
- Whole test in EVM condition (3,980 kg).
- 6,000 L of very poor diesel with sulfur content of around 6,000 ppm was stocked in a tanker in origin point of daily hauling to guarantee running under highly poor fuel quality during the whole test.
- Engine is being switched off during night time for 8 hours every day.
- This testing condition is called 2<sup>nd</sup> round of the road test
- This round of the test was covered from 51,586 km till 54,405 km i.e. ~ 2,800 km

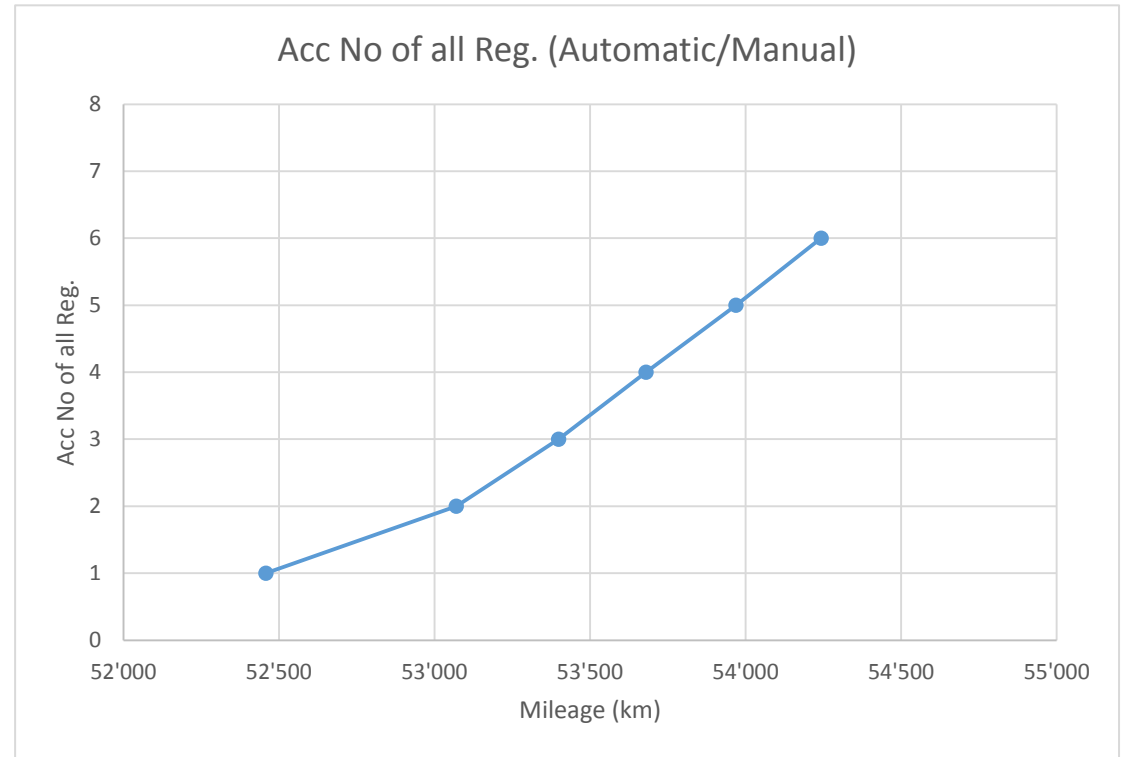

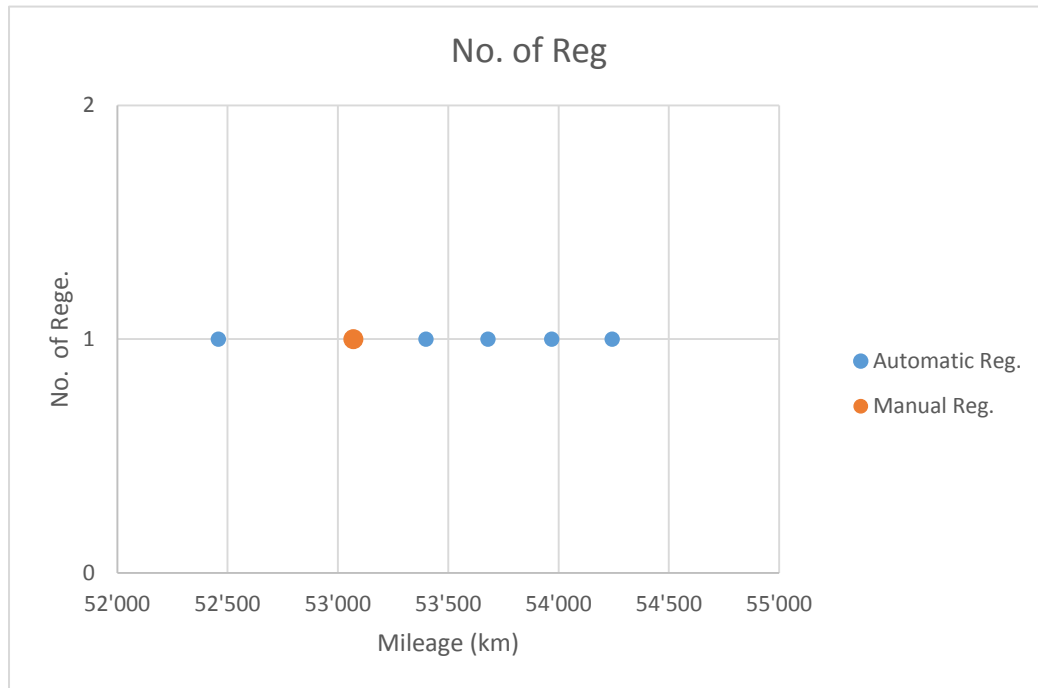

# Routes

- Pure city driving, mostly in most dense and heaviest traffic jam.

# DPF Regeneration

- 1 manual Reg. was requested by ECU in 1<sup>st</sup> week of this round of the test.
- 4 automatic regeneration and no manual regeneration have been deployed in 2<sup>nd</sup> week.
- Regeneration interval is reduced drastically in 2<sup>nd</sup> week of the test (from ~600 km to ~250 km)

# DPF and DOC cleanup procedure

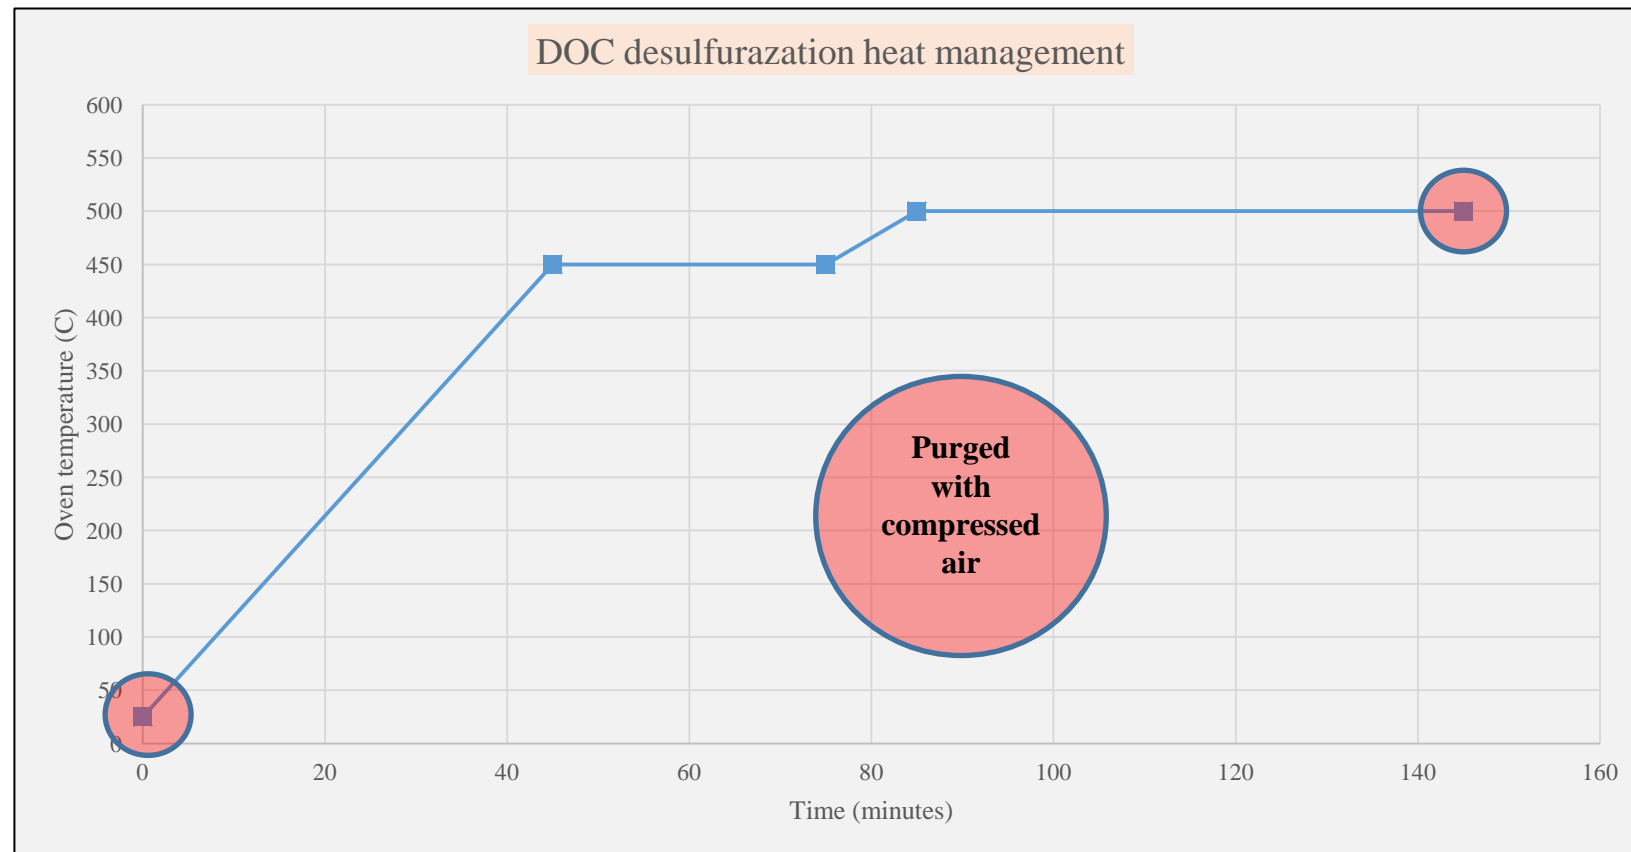

# 7-steps for cleaning procedure

- Step 1: DPF evaluation before the cleaning.
- Step 2: Separating DPF and DOC.
- Step 3: DPF cleaning.
- Step 4: DOC poisoning evaluation.
- Step 5: DOC desulfurization.
- Step 6: Evaluation of DOC activity after desulfurization.
- Step 7: Cleaning efficiency measurement

# DOC desulfurization

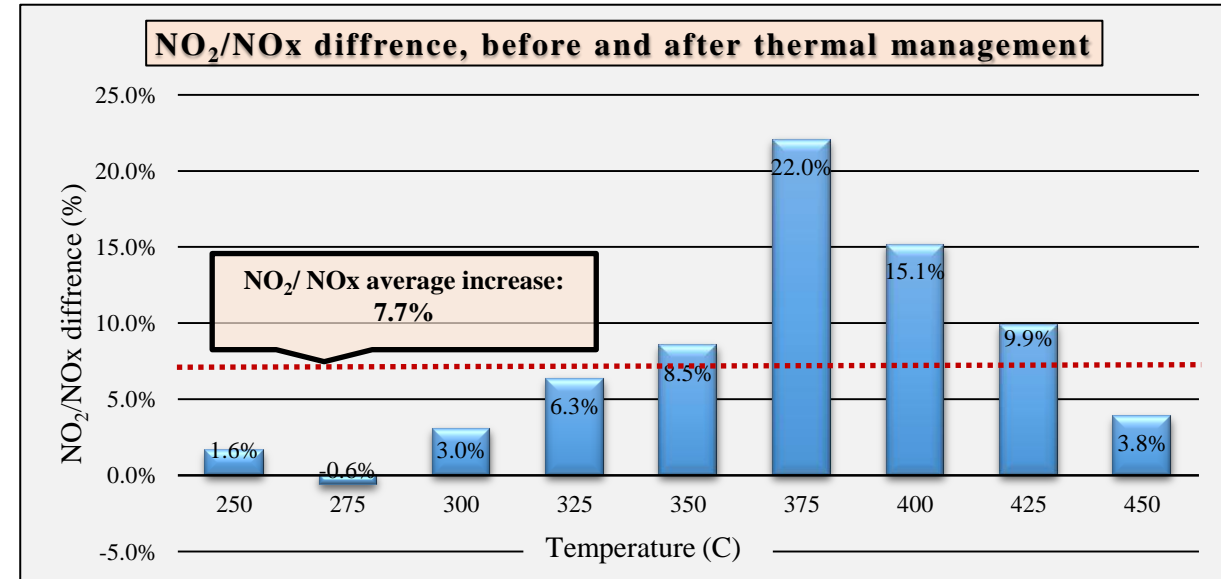

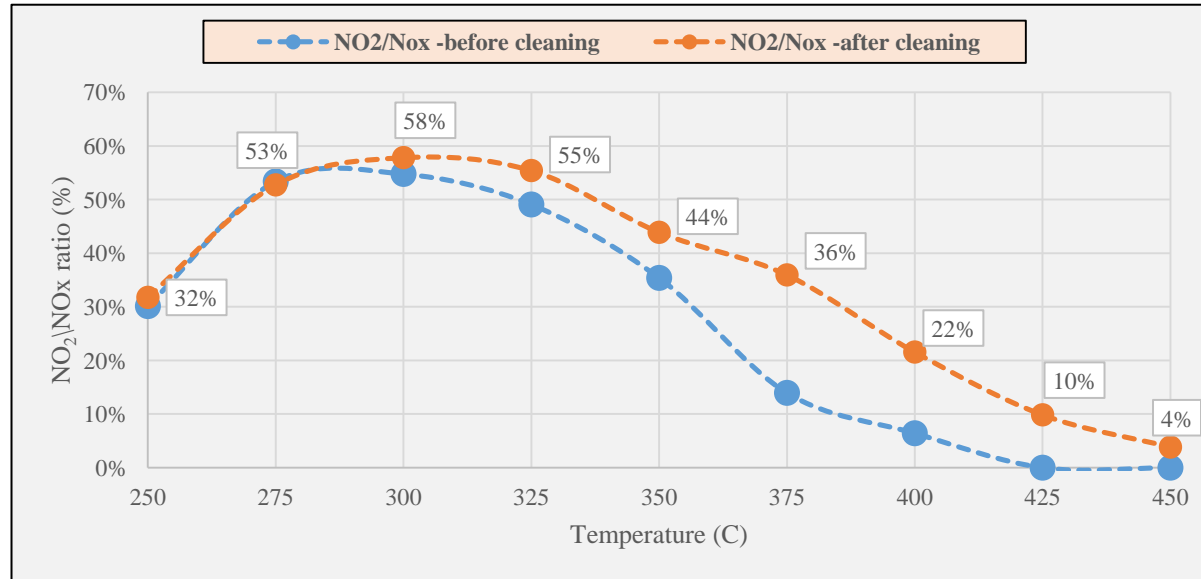

**Before  
cleaning**

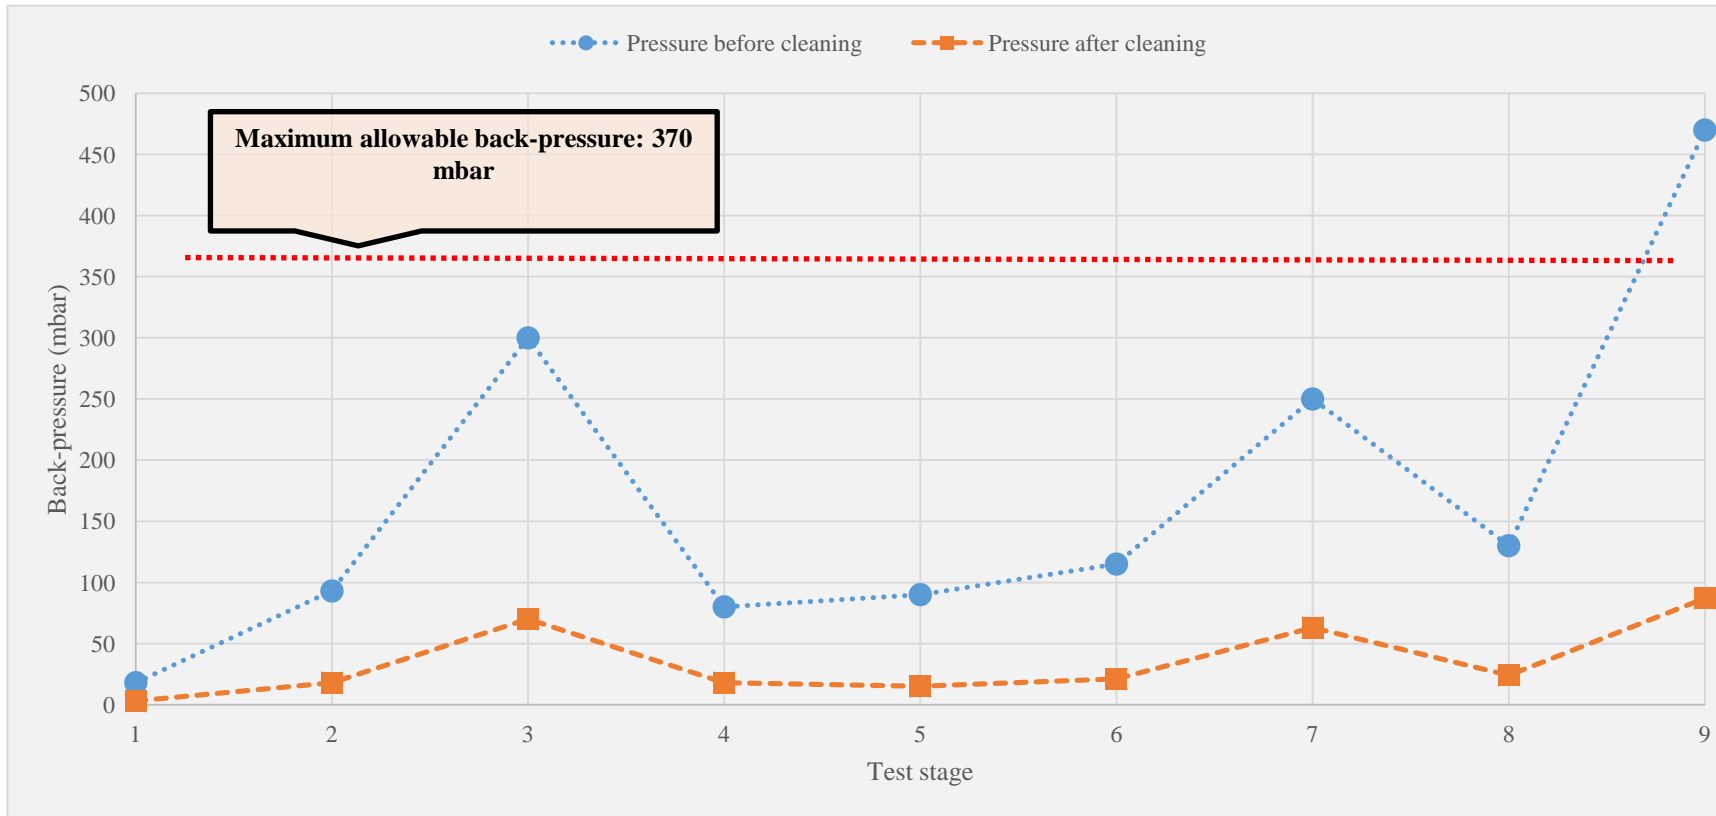

**After  
cleaning**

# Evaluation of DOC activity after desulfurization

Considering DOC activity's average values for before and after desulfurization, average improvement was 29%.

# Cleaning efficiency measurement

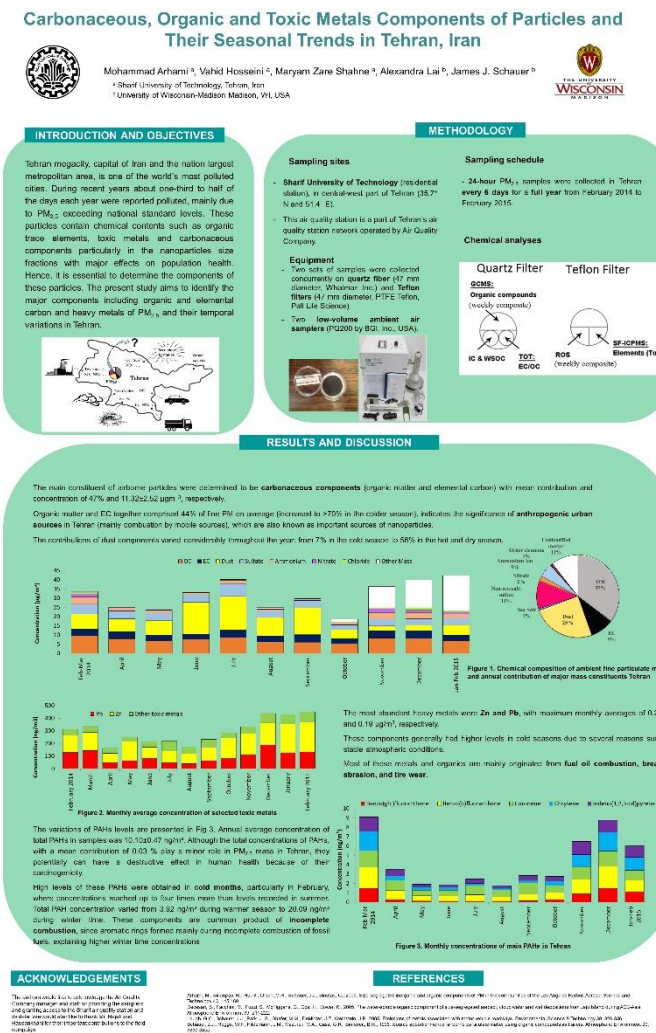

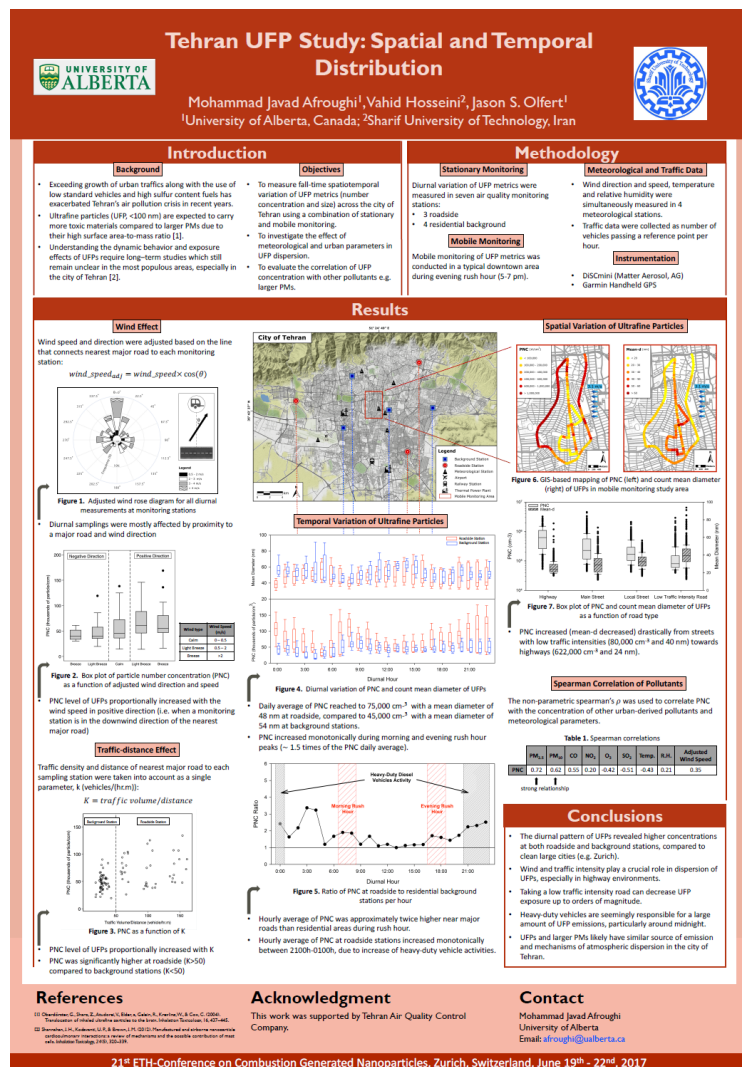

**the proposed procedure for cleaning DPF was successful. Maximum 87 mbar and average 35.4 mbar showed the DPF was in very good condition after retrieval procedure.**

# Concluding remarks

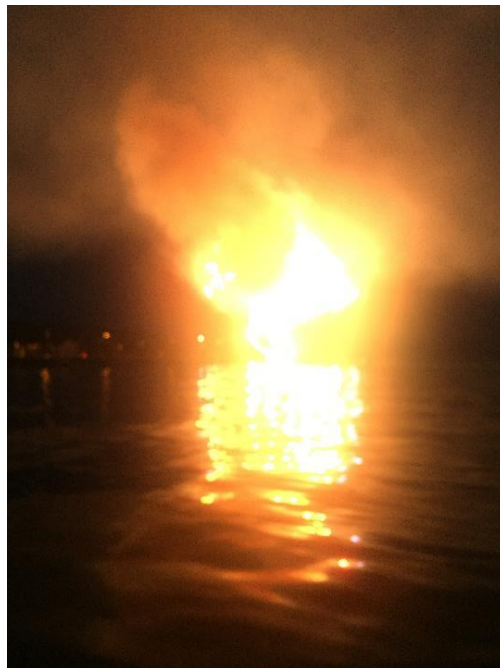

- Dire situation in Iranian megacities air with respect to PM10, PM2.5 and BC requires immediate actions
- We cannot wait for nation-wide ULSD, we need DPF now
- Novel approaches based on old European experiences are needed (there are experiences of DPF with 1200 ppm sulfur diesel in Switzerland)
- Until full implementation of Euro VI level standard (fuel, oil, AdBlue infrastructure,...) Euro IV+DPF legislation must be supported at all levels

# Please visit our posters in UFP measurement in Tehran air and source apportionment of Tehran PM2.5

Zurich  
June 20, 2017

it is all about health effects
